SELF-LEARNING CLASSIFIER FOR INTERNET TRAFFIC

Ram Keralapura, San Jose, CA (US); Marco Mellia, Turin (IT); and Luigi Grimaudo, Turin (IT)

Assigned to Narus, Inc., Sunnyvale, CA (US)

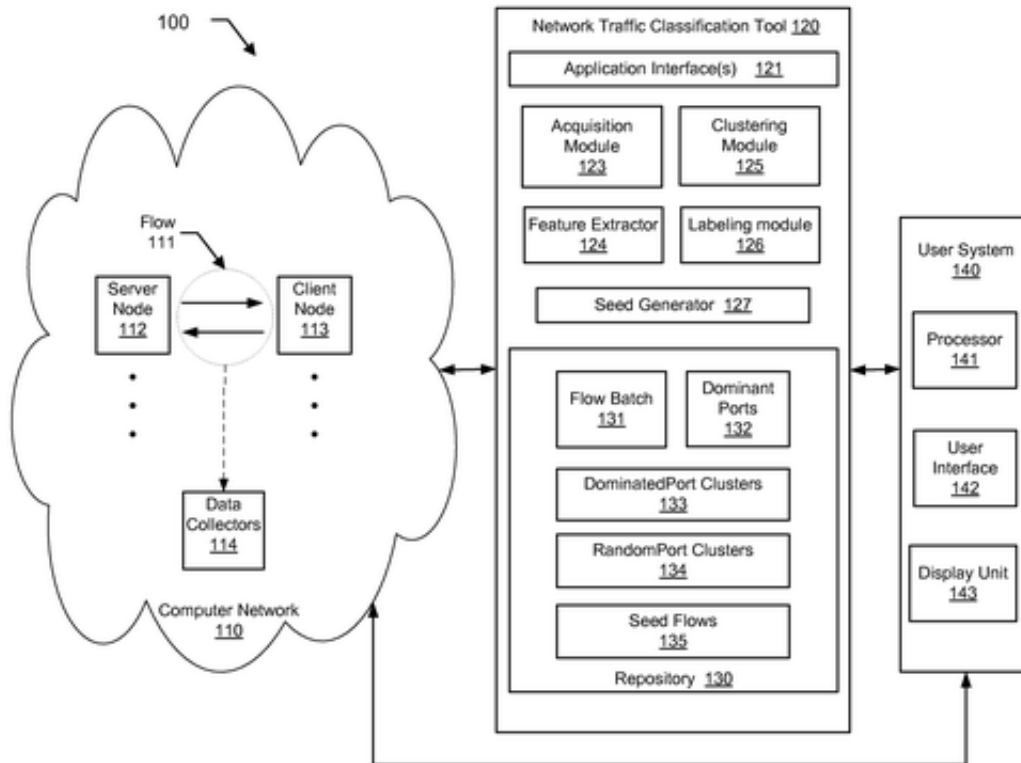

Filed by Ram Keralapura, San Jose, CA (US); Marco Mellia, Turin (IT); and Luigi Grimaudo, Turin (IT)

Filed on Nov. 18, 2011, as Appl. No. 13/300,342.

Int. Cl. G06F 15/173 (2006.01)

U.S. Cl. 709—224 [709/223]

24 Claims

1. A method for classifying network traffic in a network, comprising:
 - obtaining a first flow batch comprising a first plurality of flows from the network traffic;
 - processing, by a processor of a computer system, a first working set portion of the first flow batch for a first iteration based on a first pre-determined algorithm, comprising:
 - dividing the first working set portion into a plurality of clusters; and
 - filtering, based on a server port found in the cluster, a cluster of the plurality of clusters to generate a filtered cluster and a second working set portion of the first flow batch;
 - processing the second working set portion for a second iteration based on the first pre-determined algorithm; and
 - classifying the first flow batch based at least on the filtered cluster,
 - wherein filtering the cluster based on the server port comprises:
 - identifying a first server port as most frequently occurring comparing to all other server ports in the cluster;
 - in response to determining that a first frequency of occurrence of the first server port in the cluster exceeds a pre-determined threshold:
 - removing, from the cluster, a flow having a different server port than the first server port to generate the filtered cluster, wherein the filtered cluster is identified as a dominatedPort cluster based on a pre-determined criterion;
 - and
 - removing the dominatedPort cluster from the first working set portion to generate a remainder as a second working set portion.
