**Figure S1.** Long-time *I-t* curves (12 h) at 0.3 V vs. Ag/AgCl under AM 1.5G simulated solar illumination (100 mW/cm<sup>2</sup>) of TiO<sub>2</sub> NTs and ZnO@TiO<sub>2</sub> photoelectrodes.

**Figure S2.** 45° tilted view FESEM images of the different nanostructures after PEC tests: a) TiO<sub>2</sub> NPs, b) TiO<sub>2</sub> NTs after additional 12h CA, c) ZnO NWs and d) ZnO@TiO<sub>2</sub> core shells after additional 12h CA. White circle put in evidence the early corrosion stage of the ZnO NWs
