GLOBAL ENTROPY WEAK SOLUTIONS FOR GENERAL
NON-LOCAL TRAFFIC FLOW MODELS WITH ANISOTROPIC KERNEL

FELISIA ANGELA CHIARELLO AND PAOLA GOATIN

Abstract. We prove the well-posedness of entropy weak solutions for a class of scalar conservation laws with non-local flux arising in traffic modeling. We approximate the problem by a Lax-Friedrichs scheme and we provide $L^\infty$ and BV estimates for the sequence of approximate solutions. Stability with respect to the initial data is obtained from the entropy condition through the doubling of variable technique. The limit model as the kernel support tends to infinity is also studied.

Mathematics Subject Classification. 35L65, 65M12.

Received July 24, 2017. Accepted December 26, 2017.

1. Introduction

We consider the following scalar conservation law with non-local flux
\begin{equation}
\partial_t \rho + \partial_x \left( f(\rho) v(J_{\gamma} \ast \rho) \right) = 0, \quad x \in \mathbb{R}, \ t > 0, \tag{1.1}
\end{equation}
where
\begin{equation}
J_{\gamma} \ast \rho(t, x) := \int_{x}^{x+\gamma} J_{\gamma}(y-x) \rho(t, y) dy, \quad \gamma > 0. \tag{1.2}
\end{equation}

In (1.1), (1.2), we assume the following hypotheses:

(H) \begin{align*}
&f \in C^1(I; \mathbb{R}^+), \quad I = [a,b] \subseteq \mathbb{R}^+, \\
v \in C^2(I; \mathbb{R}^+) \text{ s.t.} \quad v' \leq 0, \\
&J_{\gamma} \in C^1([0,\gamma]; \mathbb{R}^+) \text{ s.t.} \quad J_{\gamma}' \leq 0 \text{ and } \int_{0}^{\gamma} J_{\gamma}(x) dx := J_{\gamma}, \quad \forall \gamma > 0, \lim_{\gamma \to \infty} J_{\gamma}(0) = 0.
\end{align*}

This class of equations includes in particular some vehicular traffic flow models [4, 11, 16, 19], where $\gamma > 0$ is proportional to the look-ahead distance and the integral $J_{\gamma}$ is the interaction strength (here assumed to be

Keywords and phrases: Non-local conservation laws, Lax-Friedrichs scheme.

independent of $\gamma$). In this setting, the non-local dependence of the speed function $v$ can be interpreted as the reaction of drivers to a weighted mean of the downstream traffic density. Unlike similar non-local equations [2, 3, 6–8, 12, 20], these models are characterized by the presence of an anisotropic discontinuous kernel, which makes general theoretical results [1–3] inapplicable as such. On the other side, the specific monotonicity assumptions on the speed function $v$ and the kernel $J_\gamma$ ensure nice properties of the corresponding solutions, such as a strong maximum principle (both from below and above) and the absence of unphysical oscillations due to a sort of monotonicity preservation, which make the choice (1.2) interesting and justified from the modeling perspective.

Adding an initial condition

$$\rho(0, x) = \rho_0(x), \quad x \in \mathbb{R}, \quad (1.3)$$

with $\rho_0 \in BV(\mathbb{R}; I)$, entropy weak solutions of problem (1.1), (1.3), are intended in the following sense [2, 3, 14].

**Definition 1.1.** A function $\rho \in (L^1 \cap L^\infty \cap BV)(\mathbb{R}^+ \times \mathbb{R}; I)$ is an entropy weak solution of (1.1), (1.3), if

$$\int_0^{+\infty} \int_\mathbb{R} \{|\rho - \kappa|\varphi_t + \text{sgn}(\rho - \kappa)(f(\rho) - f(\kappa))v(J_\gamma \ast \rho)\varphi_x
- \text{sgn}(\rho - \kappa)f(\kappa)(J_\gamma \ast \rho)\varphi_x\} dxdt + \int_\mathbb{R} |\rho_0(x) - \kappa|\varphi(0, x)dx \geq 0 \quad (1.4)$$

for all $\varphi \in C^1_c(\mathbb{R}^2; \mathbb{R}^+)$ and $\kappa \in \mathbb{R}$.

The main results of this paper are the following.

**Theorem 1.2.** Let hypotheses (H) hold and $\rho_0 \in BV(\mathbb{R}; I)$. Then the Cauchy problem (1.1), (1.3), admits a unique weak entropy solution $\rho^\gamma$ in the sense of Definition 1.1, such that

$$\min_{\mathbb{R}} \{\rho_0\} \leq \rho^\gamma(t, x) \leq \max_{\mathbb{R}} \{\rho_0\}, \quad \text{for a.e. } x \in \mathbb{R}, \: t > 0. \quad (1.5)$$

Moreover, for any $T > 0$ and $\tau > 0$, the following estimates hold:

$$\text{TV}(\rho^\gamma(T, \cdot)) \leq e^{C(J_\gamma)T} \text{TV}(\rho_0), \quad (1.6a)$$

$$\|\rho^\gamma(T, \cdot) - \rho^\gamma(T - \tau, \cdot)\|_{L^1} \leq \tau e^{C(J_\gamma)T} (\|f'\|_1 \|v\|_1 + J_0 \|f\|_1 \|v'\|_1) \text{TV}(\rho_0), \quad (1.6b)$$

with $C(J_\gamma) := J_\gamma (0) \left(\|v'\|_1 (\|f'\|_1 \|\rho_0\|_1 + 2\|f\|_1) + \frac{7}{2} J_0 \|f\|_1 \|v''\|_1\right)$.

Above, and in the sequel, we use the compact notation $\|\cdot\|$ for $\|\cdot\|_{L^\infty}$.

**Corollary 1.3.** Let hypotheses (H) hold and $\rho_0 \in BV(\mathbb{R}; I)$. As $\gamma \to \infty$, the solution $\rho^\gamma$ of (1.1), (1.3) converges in the $L^1_{\text{loc}}$-norm to the unique entropy weak solution of the classical Cauchy problem

$$\begin{cases}
\partial_t \rho + \partial_x (f(\rho)v(0)) = 0, & x \in \mathbb{R}, \: t > 0 \\
\rho(0, x) = \rho_0(x), & x \in \mathbb{R}.
\end{cases} \quad (1.7)$$

In particular, we observe that $C(J_\gamma) \to 0$ in (1.6a) and (1.6b), allowing to recover the classical estimates.

The paper is organized as follows. Section 2 is devoted to the proof of the stability of solutions with respect to the initial data, based on a doubling of variable argument [14]. We observe that, for a close class of non-local equations, uniqueness of solutions has been recently derived in [13] relying on characteristics method and a fixed-point argument, thus avoiding the use of entropy conditions. In our setting, we prefer to keep the classical approach to pass to the limit $\gamma \to \infty$. 

In Section 3 we derive existence of solutions through an approximation argument based on a Lax-Friedrichs type scheme. In particular, we prove accurate $L^\infty$ and BV estimates on the approximate solutions, which allow to derive (1.5) and (1.6). We remark once again that these estimates heavily rely on the monotonicity properties of $J_\gamma$, and do not hold for general kernels, see [2, 4]. Note that, regarding the Arrhenius look-ahead model [19], our result allows to establish a global well-posedness result and more accurate $L^\infty$ estimates with respect to previous studies [16]. Moreover, to our knowledge, Corollary 1.3 provides the first convergence proof of a limiting procedure on the kernel support. We present some numerical tests illustrating this convergence in Section 4. Besides the mathematical implications of such result, Corollary 1.3 may give information on connected autonomous vehicle traffic flow characteristics. Indeed, large kernel supports could account for the information transmission range between connected vehicles. On the contrary, we have currently no hint on the limit $\gamma \to 0$, which was investigated numerically in [2, 4, 11], since in this case the constants in (1.6) blow up. The counterexamples provided recently in [5] do not cover the problem studied here.

2. Uniqueness and stability of entropy solutions

The Lipschitz continuous dependence of entropy solutions with respect to initial data can be derived using Kružkov’s doubling of variable technique [14] as in [3, 4, 11].

Theorem 2.1. Under hypotheses (H), let $\rho, \sigma$ be two entropy solutions to (1.1) with initial data $\rho_0, \sigma_0$ respectively. Then, for any $T > 0$ there holds

$$\|\rho(t, \cdot) - \sigma(t, \cdot)\|_{L^1} \leq e^{KT}\|\rho_0 - \sigma_0\|_{L^1}, \quad \forall t \in [0, T],$$

with $K$ given by (2.5).

Proof. The functions $\rho$ and $\sigma$ are respectively entropy solutions of

$$\begin{align*}
\partial_t \rho(t, x) + \partial_x (f(\rho(t, x))V(t, x)) &= 0, \quad V := v(\rho * J_\gamma), \quad \rho(0, x) = \rho_0(x), \\
\partial_t \sigma(t, x) + \partial_x (f(\sigma(t, x))U(t, x)) &= 0, \quad U := v(\sigma * J_\gamma), \quad \sigma(0, x) = \sigma_0(x).
\end{align*}$$

$V$ and $U$ are bounded measurable functions and are Lipschitz continuous w.r. to $x$, since $\rho, \sigma \in (L^1 \cap L^\infty \cap BV)(\mathbb{R}^+ \times \mathbb{R} ; \mathbb{R})$. In particular, we have

$$\|V_x\| \leq 2J_\gamma(0)\|v'\|\|\rho\|, \quad \|U_x\| \leq 2J_\gamma(0)\|v'\|\|\sigma\|.$$  

Using the classical doubling of variables technique introduced by Kružkov, we obtain the following inequality:

$$\begin{align*}
\|\rho(T, \cdot) - \sigma(T, \cdot)\|_{L^1} &\leq \|\rho_0 - \sigma_0\|_{L^1} \\
&\quad + \|f'\| \int_0^T \int_{\mathbb{R}} |\rho_x(t, x)||U(t, x) - V(t, x)|dx dt \\
&\quad + \int_0^T \int_{\mathbb{R}} |f(\rho(t, x))||U_x(t, x) - V_x(t, x)|dx dt.
\end{align*}$$

(2.2)

We observe that

$$|U(t, x) - V(t, x)| \leq J_\gamma(0)\|v'\|\|\rho(t, \cdot) - \sigma(t, \cdot)\|_{L^1},$$

(2.3)
and that for a.e. $x \in \mathbb{R}$

\[
|U_x(t, x) - V_x(t, x)| \leq (2(J_\gamma(0))^2 \|v''\| \|\rho(t, \cdot)\| + \|v'\| \|J'_\gamma\|) \|\rho(t, \cdot) - \sigma(t, \cdot)\|_{L^1} \\
+ J_\gamma(0) \|v'\| ((|\rho - \sigma(t, x + \gamma) + |\rho - \sigma(t, x)|).
\]  

(2.4)

Plugging (2.3) and (2.4) into (2.2), we get

\[
\|\rho(T, \cdot) - \sigma(T, \cdot)\|_{L^1} \leq \|\rho_0 - \sigma_0\|_{L^1} + K \int_0^T \|\rho(t, \cdot) - \sigma(t, \cdot)\|_{L^1} dt
\]

with

\[
K = J_\gamma(0) \|v'\| \left( \left\|f'\right\| \sup_{t \in [0, T]} \|\rho(t, \cdot)\|_{BV(\mathbb{R})} + 2 \sup_{t \in [0, T]} \|f(\rho(t, \cdot))\| \\
+ \sup_{t \in [0, T]} \|f(\rho(t, \cdot))\|_{L^1} \left(2(J_\gamma(0))^2 \|v''\| \sup_{t \in [0, T]} \|\rho(t, \cdot)\| + \|v'\| \|J'_\gamma\| \right) \right).
\]  

(2.5)

By Gronwall’s lemma, we get the thesis. \qed

3. Existence

3.1. Lax-Friedrichs numerical scheme

We discretize (1.1) on a fixed grid given by the cells interfaces $x_{j+\frac{1}{2}} = j\Delta x$ and the cells centers $x_j = (j - 1/2)\Delta x$ for $j \in \mathbb{Z}$, taking a space step $\Delta x$ such that $\gamma = N\Delta x$ for some $N \in \mathbb{N}$, and $t^n = n\Delta t$ the time mesh. Our aim is to construct a finite volume approximate solution $\rho_\Delta(t, x) = \rho_j^n$ for $(t, x) \in C^n_j = [t^n, t^{n+1}[\times]x_{j-1/2}, x_{j+1/2}]$. We approximate the initial datum $\rho_0$ with the piecewise constant function

\[
\rho_j^0 = \frac{1}{\Delta x} \int_{x_{j-1/2}}^{x_{j+1/2}} \rho_0(x) dx.
\]

We denote $J_\gamma^k := J_\gamma(k\Delta x)$ for $k = 0, ..., N - 1$ and set

\[
V_j^n := v(c_j^n),
\]

where

\[
c_j^n := \Delta x \sum_{k=0}^{N-1} J_\gamma^k \rho_j^{n+1}.
\]

The Lax-Friedrichs flux adapted to (1.1) is given by

\[
F_{j+1/2}^n := \frac{1}{2} f(\rho_j^n) V_j^n + \frac{1}{2} f(\rho_{j+1}^n) V_{j+1}^n + \alpha (\rho_j^n - \rho_{j+1}^n),
\]  

(3.1)

$\alpha \geq 0$ being the viscosity coefficient. In this way, we obtain the $N + 2$ points finite volume scheme

\[
\rho_j^{n+1} = H(\rho_j^n, ..., \rho_j^{n+N}),
\]  

(3.2)
Proof. We follow closely the idea in [4]. We start observing that for all \( j \)

\[
H(\rho_{j-1}, ..., \rho_{j+N}) := \rho_j + \frac{\lambda}{2} \alpha (\rho_{j-1} - 2\rho_j + \rho_{j+1}) + \frac{\lambda}{2} \left( f(\rho_{j-1})V_{j-1}^n - f(\rho_{j+1})V_{j+1}^n \right),
\]

with \( \lambda = \Delta t / \Delta x \).

Assume \( \rho_i \in I \) for \( i = j - 1, ..., j + N \), we can compute:

\[
\frac{\partial H}{\partial \rho_{j-1}} = \frac{\lambda}{2} \left( \alpha + V_{j-1}f'(\rho_{j-1}) + \Delta x v'(c_{j-1})J_\gamma f(\rho_{j-1}) \right),
\]

\[
\frac{\partial H}{\partial \rho_j} = 1 - \lambda \left( \alpha - \frac{1}{2} \Delta x f(\rho_{j-1})v'(c_{j-1})J_\gamma \right) \geq 1 - \lambda \left( \alpha + \frac{1}{2} \Delta x J_\gamma (0) \| f' \| \| v' \| \right),
\]

\[
\frac{\partial H}{\partial \rho_{j+1}} = \frac{\lambda}{2} \left( \alpha + \Delta x f(\rho_{j-1})v'(c_{j-1})J_\gamma - f(\rho_{j+1})V_{j+1} - \Delta x f(\rho_{j+1})v'(c_{j+1})J_\gamma \right),
\]

\[
\frac{\partial H}{\partial \rho_{j+k}} = -\frac{\lambda}{2} \Delta x f(\rho_{j+1})v'(c_{j+1})J_\gamma^{N-k}, \quad k = 2, ..., N - 2,
\]

\[
\frac{\partial H}{\partial \rho_{j+N-1}} = -\frac{\lambda}{2} \Delta x f(\rho_{j+1})v'(c_{j+1})J_\gamma^{N-2},
\]

\[
\frac{\partial H}{\partial \rho_{j+N}} = -\frac{\lambda}{2} \Delta x f(\rho_{j+1})v'(c_{j+1})J_\gamma^{N-1}.
\]

We have that (3.4e) and (3.4f) are non-negative. The positivity of (3.4b) follows assuming

\[
\Delta t \leq \frac{2}{2\alpha + \Delta x J_\gamma (0) \| f' \| \| v' \| \Delta x},
\]

which gives the CFL condition. Moreover, the bound

\[
\alpha \geq \| f' \| \| v' \| + \Delta x J_\gamma (0) \| f' \| \| v' \|
\]

guarantees the increasing monotonicity w.r.t. \( \rho_{j-1} \) and \( \rho_{j+1} \), respectively in (3.4a) and in (3.4c). The sign of (3.4d) cannot be a priori determined and for this reason the numerical scheme (3.2), (3.3) is not monotone.

3.2. Maximum principle and \( L^\infty \) estimates

Proposition 3.1. Let hypotheses (H) hold. Given an initial datum \( \rho_j^0, j \in \mathbb{Z} \), such that \( \rho_m = \min_{j \in \mathbb{Z}} \rho_j^0 \in I \) and \( \rho_M = \max_{j \in \mathbb{Z}} \rho_j^0 \in I \), the finite volume approximation \( \rho_j^n, j \in \mathbb{Z} \) and \( n \in \mathbb{N} \), constructed using the scheme (3.2), (3.3), satisfies the bounds

\[
\rho_m \leq \rho_j^n \leq \rho_M,
\]

for all \( j \in \mathbb{Z} \) and \( n \in \mathbb{N} \), under the CFL condition (3.5).

Proof. We follow closely the idea in [4]. We start observing that

\[
H(\rho_m, \rho_m, \rho_m, \rho_{j+2}, ..., \rho_{j+N-2}, \rho_m, \rho_m) \geq \rho_m,
\]

\[
H(\rho_M, \rho_M, \rho_M, \rho_{j+2}, ..., \rho_{j+N-2}, \rho_M, \rho_M) \leq \rho_M.
\]
Indeed, we get

\[ H(\rho_m, \rho_m, \rho_m, \rho_{j+2}, \ldots, \rho_{j+N-2}, \rho_m, \rho_m) = \rho_m + \frac{\lambda}{2} f(\rho_m) (V_{j-1}^n - V_{j+1}^n), \]

and we have that

\[ V_{j-1}^n - V_{j+1}^n = v(c_{j-1}^n) - v(c_{j+1}^n) = -v'(\xi) \Delta x \sum_{k=0}^{N-1} J_\gamma^k (\rho_{j+k+1} - \rho_{j+k-1}) \geq 0, \]

for some \( \xi \) is between \( c_{j-1}^n \) and \( c_{j+1}^n \). Indeed, due to the non-increasing monotonicity of \( J_\gamma \), we observe that

\[
\sum_{k=0}^{N-1} J_\gamma^k (\rho_{j+k+1} - \rho_{j+k-1}) = \rho_m (J_\gamma^{N-2} + J_\gamma^{N-1} - J_\gamma^0 - J_\gamma^1) + \sum_{k=1}^{N-2} \rho_{j+k} (J_\gamma^{k-1} - J_\gamma^{k+1}) \geq \rho_m (J_\gamma^{N-2} + J_\gamma^{N-1} - J_\gamma^0 - J_\gamma^1) + \rho_m \sum_{k=1}^{N-2} (J_\gamma^{k-1} - J_\gamma^{k+1}) = \rho_m \left( \sum_{k=1}^{N} J_\gamma^{k-1} - \sum_{k=-1}^{N-2} J_\gamma^{k+1} \right) = 0.
\]

In this way we have the inequality (3.7) and the same procedure leads to (3.8).

Consider now the points

\[ R_j^n = (\rho_{j-1}^n, \ldots, \rho_{j+N}^n) \]

and

\[ R_m^n = (\rho_m, \rho_m, \rho_m, \rho_{j+2}^n, \ldots, \rho_{j+N-2}^n, \rho_m, \rho_m). \]

Applying the mean value theorem and using (3.7) one has

\[
\rho_{j+1}^n = H(R_j^n) = H(R_m^n) + \nabla H(R_\xi) \cdot (R_j^n - R_m^n) \\
\geq \rho_m + \nabla H(R_\xi) \cdot (R_j^n - R_m^n),
\]

for \( R_\xi = (1 - \xi) R_m^n + \xi R_j^n \), for some \( \xi \in [0, 1] \). We note that

\[
\frac{\partial H}{\partial \rho_{j+k}}(R_\xi)(R_j^n - R_m^n)_k = 0, \quad k = 2, \ldots, N-2,
\]

since \( (R_j^n - R_m^n)_k = 0 \) for \( k = 2, \ldots, N-2 \). Assuming (3.5) and (3.6), we conclude, from the discussion in Section 3.1,

\[ \nabla H(R_\xi) \cdot (R_j^n - R_m^n) \geq 0, \]

which by (3.9) implies that \( \rho_{j+1}^n \geq \rho_m \).

Similarly we can prove the upper bound by considering

\[ R_M^n = (\rho_M, \rho_M, \rho_M, \rho_{j+2}^n, \ldots, \rho_{j+N-2}^n, \rho_M, \rho_M). \]
and (3.8).

\[ \square \]

### 3.3. BV estimates

The approximate solutions constructed using adapted Lax-Friedrichs numerical scheme have uniformly bounded total variation.

**Proposition 3.2.** Let hypotheses (H) hold, \( \rho_0 \in BV(\mathbb{R}; I) \), and let \( \rho_{\Delta x} \) be constructed using (3.2), (3.3). If

\[
\alpha \geq \|f'\|\|v\| + \Delta x J_\gamma(0)\|v'\|(\|f\| + \|f'\|\|\rho_0\|),
\]

\[
\Delta t \leq \frac{2\Delta x}{2\alpha + \Delta x J_\gamma(0)\|v'\|(\|f\| + \|f'\|\|\rho_0\|)},
\]

then for every \( T > 0 \) the following discrete space \( BV \) estimate holds

\[
TV(\rho_{\Delta x})(T, \cdot) := \sum_{j \in \mathbb{Z}} \left| \rho_j^{[T/\Delta t]} - \rho_j^{[T/\Delta t]} \right| \leq c^{C(J_\gamma)T} TV(\rho_0), \tag{3.10}
\]

where \( C(J_\gamma) := J_\gamma(0)\left(\|v'\|(\|f'\|\|\rho_0\| + 2\|f\|) + \frac{7}{2} J_0\|f\|\|v''\|\right) \).

In (3.10) we have used the notation \( [T/\Delta t] := \max \left\{ n \in \mathbb{N} : n \leq \frac{T}{\Delta t} \right\} \).

**Proof.** At the mesh cell \( C_j^n \) there holds

\[
\rho_j^{n+1} = \rho_j + \frac{\lambda\alpha}{2}(\rho_{j-1} - 2\rho_j + \rho_{j+1}) + \frac{\lambda}{2}(f(\rho_{j-1})V_{j-1} - f(\rho_{j+1})V_{j+1}),
\]

and at \( C_{j+1}^n \)

\[
\rho_{j+1}^{n+1} = \rho_{j+1} + \frac{\lambda\alpha}{2}(\rho_j - 2\rho_{j+1} + \rho_{j+2}) + \frac{\lambda}{2}(f(\rho_j)V_j - f(\rho_{j+2})V_{j+2}),
\]

where we omitted the superscript \( n \) to simplify the notation. Computing the difference between \( \rho_{j+1}^{n+1} \) and \( \rho_j^{n+1} \) and setting \( \Delta_{j+k-1/2}^n = \rho_{j+k}^n - \rho_{j+k-1}^n \) for \( k = 0, \ldots, N + 1 \) we get:

\[
\Delta_{j+1/2}^{n+1} = \Delta_{j+1/2}^n + \frac{\lambda\alpha}{2}[\Delta_{j-1/2}^{n+1} - 2\Delta_{j+1/2}^n + \Delta_{j+3/2}^n]
\]

\[
+ \frac{\lambda}{2} [f(\rho_j)V_j + f(\rho_{j-1})V_j - f(\rho_{j-1})V_j - f(\rho_{j-1})V_{j-1}]
\]

\[
- f(\rho_{j+2})V_{j+2} + f(\rho_{j+1}V_{j+2} - f(\rho_{j+1}V_{j+1}) + f(\rho_{j+1})V_{j+1}] . \tag{3.11}
\]

Applying the mean value theorem we can rewrite (3.11) as:

\[
\Delta_{j+1/2}^{n+1} = \Delta_{j+1/2}^n + \frac{\lambda\alpha}{2}[\Delta_{j-1/2}^{n+1} - 2\Delta_{j+1/2}^n + \Delta_{j+3/2}^n]
\]

\[
+ \frac{\lambda}{2} [V_j f'(\zeta_{j-1/2})\Delta_{j-1/2}^n + f(\rho_{j-1})V_{j-1} - V_{j+2}f'(\zeta_{j+3/2})\Delta_{j+3/2}^n + f(\rho_{j+1})(V_{j+1} - V_{j+2})] . \tag{3.12}
\]
where $\zeta_{j-1/2}$ is between $\rho_{j-1}$ and $\rho_j$. Applying the mean value theorem we have

$$V_j - V_{j-1} = v'(\xi_{j-1/2}) \Delta x \sum_{k=0}^{N-1} J^k_{\gamma} \Delta_{j+k-1/2},$$

and

$$V_{j+1} - V_j = v'(\xi_{j+1/2}) \Delta x \sum_{k=0}^{N-1} J^k_{\gamma} \Delta_{j+k+1/2},$$

where $\xi_{j+3/2}$ is between $\sum_{k=0}^{N-1} J^k_{\gamma} \rho_{j+k+1}$ and $\sum_{k=0}^{N-1} J^k_{\gamma} \rho_{j+k+2}$. In this way we obtain

$$\Delta_{j+1/2}^{n+1} = \frac{\lambda}{2} [\alpha + V_j f'(\xi_{j-1/2}) + \Delta x \sum_{k=0}^{N-1} f(\rho_{j-1}) \Delta_{j+k-1/2} \sum_{k=0}^{N-1} J^k_{\gamma} \Delta_{j+k-1/2}$$

$$+ \frac{\lambda}{2} \Delta x \sum_{k=3}^{N-1} J^k_{\gamma} \Delta_{j+k-1/2}$$

$$+ \frac{\lambda}{2} \Delta x f(\rho_{j+1}) f'(\xi_{j+3/2}) - \Delta x J^0_{\gamma} f(\rho_{j+1}) f'(\xi_{j+3/2}) + \Delta x J^2_{\gamma} f(\rho_{j-1}) f'(\xi_{j-1/2})] \Delta_{j+3/2}$$

$$+ \frac{\lambda}{2} \Delta x f(\rho_{j+1}) f'(\xi_{j+3/2}) \sum_{k=0}^{N-1} J^k_{\gamma} \Delta_{j+k+1/2}$$

$$- \frac{\lambda}{2} \Delta x f(\rho_{j+1}) f'(\xi_{j+3/2}) \sum_{k=1}^{N-1} J^k_{\gamma} \Delta_{j+k+3/2}.\] (3.13a)

Rearranging the indexes in (3.13d) and (3.13e) we obtain

$$(3.13d) + (3.13e) = \frac{\lambda}{2} \Delta x \sum_{k=2}^{N-2} [f(\rho_{j-1}) f'(\xi_{j-1/2}) J^k_{\gamma} - f(\rho_{j+1}) f'(\xi_{j+3/2}) J^k_{\gamma}] \Delta_{j+k+1/2}$$

$$- \frac{\lambda}{2} \Delta x f(\rho_{j+1}) f'(\xi_{j+3/2}) J^{N-2}_{\gamma} \Delta_{j+N-1/2}$$

$$- \frac{\lambda}{2} \Delta x f(\rho_{j+1}) f'(\xi_{j+3/2}) J^{N-1}_{\gamma} \Delta_{j+N+1/2}.\] (3.13d)

Noting that adding and subtracting $f(\rho_{j-1}) J^{k-1}_{\gamma} f'(\xi_{j-1/2})$ in the sum we have

$$f(\rho_{j-1}) f'(\xi_{j-1/2}) J^{k+1}_{\gamma} - f(\rho_{j+1}) f'(\xi_{j+3/2}) J^{k-1}_{\gamma}$$

$$= f(\rho_{j-1}) f'(\xi_{j-1/2}) (J^{k+1}_{\gamma} - J^{k-1}_{\gamma})$$

$$+ J^{k-1}_{\gamma} (f(\rho_{j-1}) f'(\xi_{j-1/2}) + f(\rho_{j-1}) f'(\xi_{j+3/2}) - f(\rho_{j+1}) f'(\xi_{j+3/2}) - f(\rho_{j+1}) f'(\xi_{j+3/2}))$$

$$= f(\rho_{j-1}) f'(\xi_{j-1/2}) (J^{k+1}_{\gamma} - J^{k-1}_{\gamma}) + J^{k-1}_{\gamma} f(\rho_{j-1}) f'(\xi_{j-1/2}) - f(\rho_{j+1}) f'(\xi_{j+3/2})$$

$$- J^{k-1}_{\gamma} f(\xi_{j+3/2}) f'(\xi_{j}) \Delta_{j-1/2} + \Delta_{j+1/2},$$
with $\zeta_j$ is between $\rho_{j-1}$ and $\rho_{j+1}$. Therefore we get

$$
\Delta_{j+1/2}^{n+1} = \frac{\lambda}{2} \left[ \alpha + V_f f'(\zeta_{j-1/2}) + \Delta x J_{\zeta}^0 v'(\zeta_{j-1/2}) f(\rho_{j-1}) - \Delta x v'(\zeta_{j+3/2}) J_{\zeta}^0 \sum_{k=2}^{N-2} J_{\zeta}^{k-1} \Delta_{j+k+3/2} \right] \Delta_{j-1/2} (3.14a)
$$

$$
+ \left[ 1 - \lambda \alpha + \frac{\lambda}{2} \Delta x J_{\zeta}^1 v'(\zeta_{j-1/2}) f(\rho_{j-1}) - \frac{\lambda}{2} \Delta x v'(\zeta_{j+3/2}) f'(\zeta_j) \sum_{k=2}^{N-2} J_{\zeta}^{k-1} \Delta_{j+k+1/2} \right] \Delta_{j+1/2} (3.14b)
$$

$$
+ \frac{\lambda}{2} \Delta x \sum_{k=2}^{N-2} \left[ f(\rho_{j-1}) v'(\zeta_{j-1/2}) (J_{\zeta}^{k+1} - J_{\zeta}^{k-1}) + J_{\zeta}^{k-1} f(\rho_{j-1}) \left( v'(\zeta_{j+3/2}) - v'(\zeta_{j-1/2}) \right) \right] \Delta_{j+k+1/2} (3.14d)
$$

$$
- \frac{\lambda}{2} \Delta x f(\rho_{j+1}) v'(\zeta_{j+3/2}) J_{\zeta}^{N-1} \Delta_{j+N+1/2} (3.14e)
$$

Observe that the assumption $\alpha \geq \|f'\|v\| + \Delta x J_{\zeta}(0)\|v'\| + \|f'\|\|\rho_0\|$ guarantees the positivity of (3.14a). Similarly for (3.14c) we get $\alpha \geq \|f'\|\|v\| + \Delta x J_{\zeta}(0)\|f'\|\|v'\|$ and for (3.14b) we have the following CFL condition

$$
\Delta t \leq \frac{2 \Delta x}{2 \alpha + \Delta x J_{\zeta}(0)\|v'\| + \|f'\|\|\rho_0\|}. (3.15)
$$

Rearranging the indexes and taking the absolute values

$$
\sum_j |\Delta_{j+1/2}^{n+1}| \leq \sum_j |\Delta_{j+1/2}| (3.16a)
$$

$$
\times \frac{\lambda}{2} \left( \alpha + V_{j+1} f'(\zeta_{j+1/2}) + \Delta x J_{\zeta}^0 v'(\zeta_{j+1/2}) f(\rho_{j}) - \Delta x v'(\zeta_{j+5/2}) J_{\zeta}^0 \sum_{k=2}^{N-2} J_{\zeta}^{k-1} \Delta_{j+k+3/2} \right) (3.16c)
$$

$$
+ 1 - \lambda \alpha + \frac{\lambda}{2} \Delta x J_{\zeta}^1 v'(\zeta_{j-1/2}) f(\rho_{j-1}) - \frac{\lambda}{2} \Delta x v'(\zeta_{j+3/2}) f'(\zeta_j) \sum_{k=2}^{N-2} J_{\zeta}^{k-1} \Delta_{j+k+1/2} (3.16d)
$$

$$
+ \frac{\lambda}{2} \left( \alpha - V_{j+1} f'(\zeta_{j+1/2}) - \Delta x J_{\zeta}^0 f(\rho_{j}) v'(\zeta_{j+1/2}) + \Delta x J_{\zeta}^0 v'(\zeta_{j+3/2}) f(\rho_{j-2}) \right) (3.16e)
$$

$$
+ \frac{\lambda}{2} \Delta x \left( \sum_{k=2}^{N-2} f(\rho_{j-k-1}) v'(\zeta_{j-k-1/2}) (J_{\zeta}^{k+1} - J_{\zeta}^{k-1}) + J_{\zeta}^{k-1} f(\rho_{j-k-1}) \left( v'(\zeta_{j-k-1/2}) - v'(\zeta_{j-k+1/2}) \right) \right) (3.16f)
$$

$$
- \frac{\lambda}{2} \Delta x f(\rho_{j-N+1}) v'(\zeta_{j-N+3/2}) J_{\zeta}^{N-1} - \frac{\lambda}{2} \Delta x f(\rho_{j-N+1}) v'(\zeta_{j-N+3/2}) J_{\zeta}^{N-1}. (3.16g)
$$
Due to some cancellations, the coefficient of the right-hand side of (3.16) becomes

\[ 1 + \frac{\Delta t}{2} \left[ -v'(\xi_{j+5/2})f'(\xi_{j+1}) \sum_{k=2}^{N-2} J_{\gamma}^{k-1} \Delta_{j+k+3/2} - v'(\xi_{j+3/2})f'(\xi_{j}) \sum_{k=2}^{N-2} J_{\gamma}^{k-1} \Delta_{j+k+1/2} + J_{\gamma}^{1} v'(\xi_{j-1})f(\rho_{j-1}) + J_{\gamma}^{2} v'(\xi_{j-3})f(\rho_{j-2}) + \left( \sum_{k=2}^{N-2} f(\rho_{j-k}) v'(\xi_{j-k-1/2}) (J_{\gamma}^{k+1} - J_{\gamma}^{k-1}) + J_{\gamma}^{k-1} f(\rho_{j-k-1}) v'(\xi_{j-k-1/2}) - v'(\xi_{j-k+3/2}) \right) \right] \]

\[ - f(\rho_{j-N+2}) v'(\xi_{j-N+5/2}) J_{\gamma}^{N-2} - f(\rho_{j-N+1}) v'(\xi_{j-N+3/2}) J_{\gamma}^{N-1} \].

(3.17)

Following ([10], pp. 11–12), applying the mean value theorem to \( v' \) and using the monotonicity of the kernel \( J_{\gamma} \), we have

\[ |v'(\xi_{j-k-1/2}) - v'(\xi_{j-k+3/2})| \leq 7J_{\gamma}(0) \|v''\| \Delta x. \]

Therefore we have

\[ (3.17) \leq 1 + \frac{\Delta t}{2} \left[ 2J_{\gamma}(0) \|v'\| \|f'\| \|\rho_0\| + 2J_{\gamma}(0) \|v'\| \|f\| \right. \]

\[ + \|v'\| \|f\| \sum_{k=2}^{N-2} (J_{\gamma}^{k-1} - J_{\gamma}^{k+1}) + 7J_{\gamma}(0) \|v''\| \|f\| \sum_{k=2}^{N-2} J_{\gamma}^{k-1} \Delta x \sum_{k=3}^{N-1} J_{\gamma}^{k} \leq J_0 \].

Substituting in (3.16) we get

\[ \sum_{j} |\Delta_{j+1/2}^{n+1}| \leq \left[ 1 + \frac{\Delta t}{2} (2J_{\gamma}(0) \|v'\| (\|f'\| \|\rho_0\| + 2\|f\|) + 7J_{\gamma}(0) J_0 \|f\| \|v''\|) \right] \sum_{j} |\Delta_{j+1/2}^{n+1}|, \]

therefore we recover the following estimate for the total variation

\[ TV(\rho_{\Delta x}(T, \cdot)) \leq \left[ 1 + \frac{\Delta t}{2} (2J_{\gamma}(0) \|v'\| (\|f'\| \|\rho_0\| + 2\|f\|) + 7J_{\gamma}(0) J_0 \|f\| \|v''\|) \right]^{T/\Delta t} TV(\rho_{\Delta x}(0, \cdot)) \]

\[ \leq e^{J_{\gamma}(0) \|v'\| (\|f'\| \|\rho_0\| + 2\|f\|) + 7J_{\gamma}(0) J_0 \|f\| \|v''\|) T} TV(\rho_0). \]

□

From Proposition 2, the following space-time BV estimate can be derived (see [9], Cor. 5.1).

**Corollary 3.3.** Let hypotheses (H) hold, \( \rho_0 \in BV(\mathbb{R}; I) \), and \( \rho_{\Delta x} \) be given by (3.2), (3.3). If

\[ \alpha \geq \|f'\| \|v\| + \Delta x J_{\gamma}(0) \|v'\| \|f\| + \|f'\| \|\rho_0\|, \]

\[ \Delta t \leq \frac{2\Delta x}{2\alpha + \Delta x J_{\gamma}(0) \|v'\| \|f\| + \|f'\| \|\rho_0\|}, \]

then
then, for every $T > 0$, $\rho_{\Delta x}$ satisfies the following Total Variation estimate in space and time

$$TV(\rho_{\Delta x}; \mathbb{R} \times [0, T]) \leq T e^{C_1 J \gamma T} \left( 1 + \| f' \| \| v \| + \frac{1}{2} \Delta x J_\gamma(0) \| v' \| (5 \| f \| + \| f' \| \| \rho_0 \|) + J_0 \| f' \| \| v' \| \right) TV(\rho_0).$$

(3.18)

**Proof.** Let us fix $T \in \mathbb{R}^+$. If $T \leq \Delta t$, then $TV(\rho_{\Delta x}; [0, T] \times \mathbb{R}) \leq T TV(\rho_0)$. Let us assume now that $T > \Delta t$. Let $M \in \mathbb{N}\setminus\{0\}$ such that $M \Delta t < T \leq (M + 1) \Delta t$. Then

$$TV(\rho_{\Delta x}; \mathbb{R} \times [0, T]) = \sum_{n=0}^{M-1} \sum_{j \in \mathbb{Z}} \Delta t |\rho^n_{j+1} - \rho^n_j| + (T - M \Delta t) \sum_{j \in \mathbb{Z}} |\rho^M_{j+1} - \rho^M_j| + \sum_{n=0}^{M-1} \sum_{j \in \mathbb{Z}} \Delta x |\rho^{n+1}_{j} - \rho^n_j|.$$

The spatial BV estimate yields

$$\sum_{n=0}^{M-1} \sum_{j \in \mathbb{Z}} \Delta t |\rho^n_{j+1} - \rho^n_j| + (T - M \Delta t) \sum_{j \in \mathbb{Z}} |\rho^M_{j+1} - \rho^M_j| \leq T e^{C_1 J \gamma T} TV(\rho_0)$$

(3.19)

where $C(J_\gamma)$ is the constant in Proposition 3.2. We are left to bound the term

$$\sum_{n=0}^{M-1} \sum_{j \in \mathbb{Z}} \Delta x |\rho^{n+1}_{j} - \rho^n_j|.$$

Let us make use of the definition of the numerical scheme (3.2), (3.3). Applying the mean value theorem to the function $f$ we obtain

$$\rho^n_{j+1} - \rho^n_j = \frac{\lambda \alpha}{2} (\rho^n_{j-1} - \rho^n_j) + \frac{\lambda \alpha}{2} (\rho^n_{j+1} - \rho^n_j)$$

$$+ \frac{\lambda}{2} (f(\rho^n_{j-1}) V^n_{j-1} + f(\rho^n_{j-1}) V^n_{j-1} - f(\rho^n_{j-1}) V^n_{j-1} - V^n_{j+1} f(\rho^n_{j+1}))$$

$$= \frac{\lambda}{2} (\alpha + V^n_{j+1} f'(\zeta_{j+1/2})(\rho^n_{j-1} - \rho^n_j)$$

$$+ \frac{\lambda}{2} (\alpha + V^n_{j+1} f'(\zeta_{j+1/2})(\rho^n_{j} - \rho^n_{j+1})$$

$$+ \frac{\lambda}{2} f(\rho^n_{j-1}) (V^n_{j-1} - V^n_j) + \frac{\lambda}{2} f(\rho^n_{j-1}) (V^n_{j} - V^n_{j+1}),$$

where $\zeta_{j+1/2}$ is between $\rho^n_{j-1}$ and $\rho^n_j$. Applying again the mean value theorem, we obtain

$$V^n_{j-1} - V^n_j = v'(\zeta_{j-1/2}) \Delta x \sum_{k=0}^{N-1} J^k_{\gamma}(\rho^n_{j+k-1} - \rho^n_{j+k}),$$

and

$$V^n_j - V^n_{j+1} = v'(\zeta_{j+1/2}) \Delta x \sum_{k=0}^{N-1} J^k_{\gamma}(\rho^n_{j+k} - \rho^n_{j+k+1}).$$
Therefore we can write

\[
\rho_j^{n+1} - \rho_j^n = \frac{\lambda}{2} \left( \alpha + V_{j+1} f'((\xi_{j-1/2}) + f(\rho_{j-1}^n) v'((\xi_{j-1/2}) \Delta x J_1^0) (\rho_{j-1}^n - \rho_j^n) \\
- \frac{\lambda}{2} (\alpha - V_{j+1} f'((\xi_{j+1/2}) - f(\rho_{j-1}^n) v'((\xi_{j-1/2}) \Delta x J_1^0) - f(\rho_{j-1}^n) v'((\xi_{j+1/2}) \Delta x J_1^0) (\rho_j^n - \rho_{j+1}^n) \\
+ \frac{\lambda}{2} f(\rho_{j-1}^n) v'((\xi_{j-1/2}) \Delta x \sum_{k=2}^{N-1} J_k^1 (\rho_{j+k-1}^n - \rho_{j+k}^n) \\
+ \frac{\lambda}{2} f(\rho_{j-1}^n) v'((\xi_{j+1/2}) \Delta x \sum_{k=1}^{N-1} J_k^1 (\rho_{j+k}^n - \rho_{j+k+1}^n).
\]

Rearranging the indexes of the last two terms, we can write

\[
\rho_j^{n+1} - \rho_j^n = \frac{\lambda}{2} \left( \alpha + V_{j+1} f'((\xi_{j-1/2}) + f(\rho_{j-1}^n) v'((\xi_{j-1/2}) \Delta x J_1^0) (\rho_{j-1}^n - \rho_j^n) \\
- \frac{\lambda}{2} (\alpha - V_{j+1} f'((\xi_{j+1/2}) - f(\rho_{j-1}^n) v'((\xi_{j-1/2}) \Delta x J_1^0) - f(\rho_{j-1}^n) v'((\xi_{j+1/2}) \Delta x J_1^0) (\rho_j^n - \rho_{j+1}^n) \\
+ \frac{\lambda}{2} f(\rho_{j-1}^n) v'((\xi_{j-1/2}) \Delta x \sum_{k=2}^{N-1} (v'((\xi_{j-1/2}) J_k^1 + v'((\xi_{j+1/2}) \Delta x J_k^1 (\rho_{j+k}^n - \rho_{j+k+1}^n) \\
+ \frac{\lambda}{2} f(\rho_{j-1}^n) v'((\xi_{j+1/2}) \Delta x J_k^1 (\rho_{j+k+1}^n - \rho_{j+k}^n). (3.20d)
\]

Observe that the coefficients in (3.20a) and (3.20b) are positive if \( \alpha \geq ||f'|| ||v|| + \Delta x J_1(0) \alpha ||v'||. \) Therefore, taking the absolute values in (3.20) we get

\[
|\rho_j^{n+1} - \rho_j^n| = \frac{\lambda}{2} \left( \alpha + V_{j+1} f'((\xi_{j-1/2}) + f(\rho_{j-1}^n) v'((\xi_{j-1/2}) \Delta x J_1^0) |\rho_{j-1}^n - \rho_j^n| \\
+ \frac{\lambda}{2} (\alpha - V_{j+1} f'((\xi_{j+1/2}) - f(\rho_{j-1}^n) v'((\xi_{j-1/2}) \Delta x J_1^0) - f(\rho_{j-1}^n) v'((\xi_{j+1/2}) \Delta x J_1^0) |\rho_j^n - \rho_{j+1}^n| \\
- \frac{\lambda}{2} f(\rho_{j-1}^n) \Delta x \sum_{k=2}^{N-2} (v'((\xi_{j-1/2}) J_k^1 + v'((\xi_{j+1/2}) \Delta x J_k^1) |\rho_{j+k}^n - \rho_{j+k+1}^n| \\
- \frac{\lambda}{2} f(\rho_{j-1}^n) v'((\xi_{j+1/2}) \Delta x J_k^1 |\rho_{j+k+1} - \rho_{j+k}^n|.
\]
Summing on $j$ and rearranging the indexes we obtain

$$
\sum_{j \in \mathbb{Z}} \Delta t |\rho_j^{n+1} - \rho_j^n| \leq \frac{\Delta t}{2} \sum_{j \in \mathbb{Z}} |\rho_{j+1}^n - \rho_j^n| \\
\times \left[ 2\alpha + \lambda \left( V_{j+1}^n - V_{j+1}^n \right) + \Delta x f(\rho_{j+1}^n) v'(\xi_{j+1/2}) J_{\gamma}^1 - \Delta x f(\rho_{j-1}^n) v'(\xi_{j-1/2}) J_{\gamma}^1 \right] \\
- \Delta x f(\rho_{j-1}^n) v'((\xi_{j+1/2}) J_{\gamma}^1 - \Delta x \sum_{k=1}^{N-2} f(\rho_{j+k-1}^n) v'((\xi_{j-k+1/2}) J_{\gamma}^{k+1} + v'((\xi_{j-k+1/2}) J_{\gamma}^k) \\
- \Delta x f(\rho_{j-N}^n) v'((\xi_{j-N+3/2}) J_{\gamma}^{N-1}) \right] \\
\leq \frac{\Delta t}{2} \sum_{j \in \mathbb{Z}} |\rho_j^{n+1} - \rho_j^n| (2\alpha + \Delta x J_{\gamma}(0) ||v'|| (3\|f\| + \|f'\||\rho_0||) + 2J_0\|f\||\|v'\|),
$$

which yields

$$
\sum_{n=0}^{M-1} \sum_{j \in \mathbb{Z}} \Delta t |\rho_j^{n+1} - \rho_j^n| \leq T e^{C(\gamma)T} \left( \alpha + \frac{1}{2} \Delta x J_{\gamma}(0) ||v'|| (3\|f\| + \|f'\||\rho_0||) + J_0\|f\||\|v'\| \right) TV(\rho_0), \quad (3.21)
$$

since $M\Delta t < T$. Taking $\alpha = \|f'\||v| + \Delta x J_{\gamma}(0)\|f\||\|v'\|$, we obtain the bound (3.18) with

$$
\tilde{C} = T e^{C(\gamma)T} \left( 1 + \|f'\||v| + \frac{1}{2} \Delta x J_{\gamma}(0) ||v'|| (5\|f\| + \|f'\||\rho_0||) + J_0\|f\||\|v'\| \right) TV(\rho_0).
$$

Note that (3.21) allows to recover (1.6b) as $\Delta x \to 0$. \hfill \Box

### 3.4. Discrete entropy inequalities

Following [2, 4, 11], we derive a discrete entropy inequality for the approximate solution generated by (3.2), (3.3), which is used to prove that the limit of Lax-Friedrichs approximations is indeed a weak entropy solution in the sense of Definition 1.1. We denote

$$
G_{j+1/2}(u, w) := \frac{1}{2} f(u)V_j^n + \frac{1}{2} f(w)V_{j+1}^n + \frac{\alpha}{2} (u - w),
$$

$$
F_{j+1/2}^\kappa(u, w) := G_{j+1/2}(u \land \kappa, w \land \kappa) - G_{j+1/2}(u \lor \kappa, w \lor \kappa),
$$

with $a \land b = \max(a, b)$ and $a \lor b = \min(a, b)$.

**Proposition 3.4.** Under hypotheses (H), let $\rho_j^n, j \in \mathbb{Z}, n \in \mathbb{N}$, be given by (3.2), (3.3). Then, if $\alpha \geq \|f'\||v|$ and $\lambda \leq 1/\alpha$, we have

$$
|\rho_j^{n+1} - \kappa| - |\rho_j^n - \kappa| + \lambda \left( F_{j+1/2}^\kappa(\rho_j^n, \rho_{j+1}^n) - F_{j-1/2}^\kappa(\rho_{j-1}^n, \rho_j^n) \right) \\
+ \frac{\lambda}{2} \text{sgn}(\rho_j^{n+1} - \kappa) f(\kappa)(V_{j+1}^n - V_{j-1}^n) \leq 0, \quad (3.22)
$$

for all $j \in \mathbb{Z}, n \in \mathbb{N}$, and $\kappa \in \mathbb{R}$.
Proof. The proof follows closely \cite{2,4}. We detail it below for sake of completeness. We set
\[ H_j(u, w, z) = w - \lambda \left( G_{j+1/2}(w, z) - G_{j-1/2}(u, w) \right). \]

The function \( H_j \) is monotone non-decreasing with respect to each variable for \( \alpha \lambda \leq 1 \) and \( \alpha \geq \|f^\prime\|\|v\| \), which are guaranteed by (3.5) and (3.6). Indeed, we have
\[ H_j(u, w, z) = w - \frac{\lambda}{2} \left( f(z)V_{j+1}^n - f(u)V_{j-1}^n + \alpha(2w - u - z) \right), \]
so the partial derivatives are
\[
\begin{align*}
\frac{\partial H_j}{\partial u} &= \frac{\lambda}{2} (f'(u)V_{j+1}^n + \alpha), \\
\frac{\partial H_j}{\partial w} &= 1 - \lambda \alpha, \\
\frac{\partial H_j}{\partial z} &= \frac{\lambda}{2} (\alpha - f'(z)V_{j+1}^n).
\end{align*}
\]
Moreover, we have the identity
\[
H_j(\rho_{j-1}^n \land \kappa, \rho_j^n \land \kappa, \rho_{j+1}^n \land \kappa) - H_j(\rho_{j-1}^n \lor \kappa, \rho_j^n \lor \kappa, \rho_{j+1}^n \lor \kappa)
\]
\[
= |\rho_j^n - \kappa| - \lambda \left( F_{j+1/2}(\rho_j^n, \rho_{j+1}^n) - F_{j-1/2}(\rho_j^n, \rho_{j+1}^n) \right).
\]

By monotonicity,
\[
\begin{align*}
H_j(\rho_{j-1}^n \land \kappa, \rho_j^n \land \kappa, \rho_{j+1}^n \land \kappa) - H_j(\rho_{j-1}^n \lor \kappa, \rho_j^n \lor \kappa, \rho_{j+1}^n \lor \kappa) &
\geq H_j(\rho_{j-1}^n, \rho_j^n, \rho_{j+1}^n) \land H_j(\kappa, \kappa, \kappa) - H_j(\rho_{j-1}^n, \rho_j^n, \rho_{j+1}^n) \lor H_j(\kappa, \kappa, \kappa) \\
&= \left| H_j(\rho_{j-1}^n, \rho_j^n, \rho_{j+1}^n) - H_j(\kappa, \kappa, \kappa) \right| \\
&= \text{sgn} \left( H_j(\rho_{j-1}^n, \rho_j^n, \rho_{j+1}^n) - H_j(\kappa, \kappa, \kappa) \right) 	imes \left( H_j(\rho_{j-1}^n, \rho_j^n, \rho_{j+1}^n) - \frac{\lambda}{2} f(\kappa)(V_{j+1}^n - V_{j-1}^n) \right) \\
&\geq \text{sgn} \left( H_j(\rho_{j-1}^n, \rho_j^n, \rho_{j+1}^n) - \kappa \right) \times \left( H_j(\rho_{j-1}^n, \rho_j^n, \rho_{j+1}^n) - \kappa + \frac{\lambda}{2} f(\kappa)(V_{j+1}^n - V_{j-1}^n) \right) \\
&= \left| H_j(\rho_{j-1}^n, \rho_j^n, \rho_{j+1}^n) - \kappa \right| + \frac{\lambda}{2} \text{sgn} \left( H_j(\rho_{j-1}^n, \rho_j^n, \rho_{j+1}^n) - \kappa \right) f(\kappa)(V_{j+1}^n - V_{j-1}^n) \\
&= |\rho_j^n + 1 - \kappa| + \frac{\lambda}{2} \text{sgn}(\rho_j^{n+1} + 1 - \kappa) f(\kappa)(V_{j+1}^n - V_{j-1}^n),
\end{align*}
\]
by definition of the scheme (3.2), (3.3), which gives (3.22). \( \square \)

Proof of Theorem 1.2. Thanks to Proposition 3.1 and Corollary 3.3, we can apply Helly’s theorem stating that there exists a subsequence \( \rho_{\Delta x} \) that converges to some \( \rho \in (L^1 \cap L^\infty \cap BV)(\mathbb{R}^+ \times \mathbb{R}; I) \) in the \( L^1_{\text{loc}} \)-norm. One can then follow a Lax-Wendroff type argument to show that the limit function \( \rho \) is a weak entropy solution of (1.1), (1.3), in the sense of Definition 1.1. We just observe that the numerical flux also depends on \( \Delta x \), therefore
the classical argument on flux consistency and Lipschitz dependence must be replaced by direct estimates, like in [4, 10].

Proof of Corollary 1.3. When the look-ahead distance $\gamma \to \infty$, the non-local flux in (1.1) becomes a local one. Since the bounds (1.5), (1.6) are uniform as $\gamma \to \infty$, the solution $\rho^\gamma$ of problem (1.1), (3.3), tends up to a subsequence to the solution $\rho$ of the local problem (1.7) in the $L^1_{\text{loc}}$-norm when $\gamma \to \infty$. In fact, applying Lebesgue’s dominated convergence theorem in (1.4), since

$$|\text{sgn}(\rho - \kappa)(f(\rho) - f(\kappa))v(J_\gamma * \rho)| \leq 2\|f\|\|v\|$$

and

$$|\text{sgn}(\rho - \kappa)f(\kappa)v'(J_\gamma * \rho)\partial_x(J_\gamma * \rho)| \leq 3\|f\|\|\rho\|\|J_\gamma\|\|v'\|,$$

we obtain

$$\int_0^\infty \int_{\mathbb{R}} \{|\rho - \kappa|\varphi_t + \text{sgn}(\rho - \kappa)(f(\rho) - f(\kappa))v(0)\varphi_x + \int_{\mathbb{R}} |\rho_0(x) - \kappa|\varphi(0, x)dx \geq 0,$$

which is the definition of entropy weak solution for the classical equation (1.7). □

4. Numerical tests

In this section, we perform some numerical simulations to illustrate the result of Corollary 1.3, taking two different choices for the speed law $v$, the convolution kernel $J_\gamma$ and the function $f$. More precisely, we consider the models studied in [16, 19] and [4], which consist in the following equations:

$$\partial_t \rho + \partial_x \left( \rho(1 - \rho)e^{-\left( J_\gamma * \rho \right)} \right) = 0, \quad x \in \mathbb{R}, \ t > 0,$$

(4.1)

for the Arrhenius look-ahead dynamics [19], and

$$\partial_t \rho + \partial_x (\rho(1 - J_\gamma * \rho)) = 0, \quad x \in \mathbb{R}, \ t > 0,$$

(4.2)

for the Lighthill-Whitham-Richards (LWR) model with non-local velocity [4]. Equations (4.1) and (4.2) correspond to the following choices of $f \in C^1([0, 1]; \mathbb{R}^+)$ and $v \in C^2([0, 1]; \mathbb{R}^+)$:

$$f(\rho) = \rho(1 - \rho), \quad v(\rho) = e^{-\rho},$$

(4.3)

$$f(\rho) = \rho, \quad v(\rho) = (1 - \rho),$$

(4.4)

respectively. Besides, we will consider the following kernels $J_\gamma \in C^1([0, \infty]; \mathbb{R}^+)$, see [4, 15]:

- constant:
  $$J_\gamma(x) = \frac{1}{\gamma},$$

- linear decreasing:
  $$J_\gamma(x) = \frac{2}{\gamma} \left( 1 - \frac{x}{\gamma} \right).$$

For the tests, the space domain is given by the interval $[-1, 1]$ and the space discretization mesh is $\Delta x = 0.001$. We impose absorbing conditions at the boundaries, adding $N = \gamma/\Delta x$ ghost cells at the right boundary and
Figure 1: Density profiles corresponding to the non-local equation (4.1) with increasing values of $\gamma = 0.1, 1, 10$. We can observe that the nonlocal solution tends to the solution of (4.5) (red line) as $\gamma \to \infty$ (color online).
Figure 2: Density profiles corresponding to the non-local equation (4.2) with increasing values of $\gamma = 0.1, 1, 10$. We can observe that the nonlocal solution tends to the solution of (4.6) (red line) as $\gamma \to \infty$ (color online).
just one at the left, where we extend the solution constantly equal to the last value inside the domain. Our aim is to investigate the convergence of (4.3) to the solution of the LWR model [17, 18]

\[ \partial_t \rho + \partial_x (\rho (1 - \rho)) = 0, \quad (4.5) \]

and the convergence of (4.4) to the solution of the transport equation

\[ \partial_t \rho + \partial_x \rho = 0, \quad (4.6) \]

as \( \gamma \to \infty \). We study both problems with the initial datum

\[ \rho_0(x) = \begin{cases} 
0.8 & \text{for } -0.5 < x < -0.1, \\
0 & \text{otherwise},
\end{cases} \quad (4.7) \]

that describes the case of a red traffic light located at \( x = -0.1 \), which turns green at the initial time \( t = 0 \). Figures 1 and 2 illustrate the behavior for models (4.1) and (4.2), respectively, in agreement with the theoretical results.
