Abstract. We consider the 1D nonlinear Schrödinger equation with focusing point nonlinearity. “Point” means that the pure-power nonlinearity has an inhomogeneous potential and the potential is the delta function supported at the origin. This equation is used to model a Kerr-type medium with a narrow strip in the optic fibre. There are several mathematical studies on this equation and the local/global existence of solution, blow-up occurrence and blow-up profile have been investigated. In this paper we focus on the asymptotic behavior of the global solution, i.e., we show that the global solution scatters as $t \to \pm \infty$ in the $L^2$ supercritical case. The main argument we use is due to Kenig-Merle, but it is required to make use of an appropriate function space (not Strichartz space) according to the smoothing properties of the associated integral equation.

1. Introduction

In this paper, we address a theoretical study on a model, proposed in [16], that describes a wave propagation in a 1D linear medium containing a narrow strip of nonlinear material, where the nonlinear strip is assumed to be much smaller than the typical wavelength. Considering such nonlinear strip may allow to model a wave propagation in nanodevices, in particular the authors in [13] consider some nonlinear quasi periodic super lattices and investigate an interplay between the nonlinearity and the quasi periodicity. Such a strip is described as an impurity, i.e. a delta measure in the nonlinearity of nonlinear Schrödinger equation. For applications in nanodevices, it should be important to study NLS with a quasi periodic location of delta measures, but in this paper, as a first step, we will treat the Schrödinger equation which has

Key words and phrases. Schrödinger equation, nonlinear point interaction, scattering.
only one impurity in the nonlinearity:

\[
\begin{aligned}
&i \partial_t \psi + \partial_x^2 \psi + K(x)|\psi|^{p-1}\psi = 0, \quad t \in \mathbb{R}, \quad x \in \mathbb{R} \\
&\psi(x, 0) = \psi_0(x)
\end{aligned}
\]

where \( p > 1 \), and \( K = \delta \), \( \delta \) is the Dirac mass at \( x = 0 \). This singularity in the nonlinearity is interpreted as the linear Schrödinger equation:

\[
i \partial_t \psi + \partial_x^2 \psi = 0, \quad t \in \mathbb{R}, \quad x \neq 0
\]

together with the jump condition at \( x = 0 \)

\[
\psi(0, t) := \psi(0^-, t) = \psi(0^+, t) \\
\partial_x \psi(0^+, t) - \partial_x \psi(0^-, t) = -|\psi(0, t)|^{p-1}\psi(0, t).
\]

Remark that this equation (1.1) also appears as a limiting case of nonlinear Schrödinger equation with a concentrated nonlinearity (see [7]).

In [3, 11], it was proved that the equation (1.1) is locally well-posed for any \( \psi_0 \in H^1(\mathbb{R}) \) for \( p > 1 \), and Equation (1.1) has two conservative quantities: the mass

\[
M(\psi) = \int |\psi|^2
\]

and the energy

\[
E(\psi) = \frac{1}{2} \int |\partial_x \psi|^2 - \frac{1}{p+1}|\psi(0)|^{p+1}.
\]

The mass condition for the global existence/blow-up, further an analysis of the blow-up profile were established in [11, 12]. Furthermore, the problem of asymptotic stability of the standing waves of equation (1.1) has been treated in [5] and [14].

As far as we know, the asymptotic behavior, in particular, the scattering of the solution is not known for (1.1). For the standard NLS, i.e. \( K \equiv 1 \), in one dimensional case, such a result in \( H^1 \) was firstly established in [17]. This topic has been very active these decades thanks to a breakthrough result by Kenig-Merle [15]. Our proof therefore essentially will be based on Kenig-Merle [15], and some results after [15], for example [10]. However, it is required to make use of an appropriate function space (not Strichartz space) according to the smoothing properties of the associated integral equation to (1.1).

Higher-dimensional models with a generalization of the delta potential have been introduced in [2] and in [6] for the three and two-dimensional setting, respectively. While, at a qualitative level, the model in dimension three behaves like that in dimension one, the two-dimensional setting displays some uncommon features still to be understood (for the analysis of the blow-up, see [11]).

We remark that the model of a NLS with a standard power nonlinearity and a linear point interaction has been studied in [4].
Notation. If $I$ is an interval of $\mathbb{R}$, and $1 \leq r \leq \infty$, then $L^r_I$ is the space of strongly Lebesgue measurable, complex-valued functions $v$ from $I$ into $\mathbb{C}$ satisfying $\|v\|_{L^r_I} := \int_I |v(t)|^r \, dt < +\infty$ if $r < +\infty$, when $r = +\infty$, $\|v\|_{L^\infty_I} := \sup_{t \in I} |v(t)| < +\infty$. The space $C^\infty E$ denotes the space of continuous functions on $I$ with values in a Banach space $E$.

For $s \in \mathbb{R}$, we define the Sobolev space

$$H^s = \{v \in S'(\mathbb{R}), \|v\|_{H^s} := \|(1 + |\xi|^2)^{\frac{s}{2}} \hat{v}(\xi)\|_{L^2_\mathbb{R}} < +\infty\},$$

and the homogeneous Sobolev space

$$\dot{H}^s = \{v \in S'(\mathbb{R}), \|v\|_{\dot{H}^s} := \||\xi|^s \hat{v}(\xi)\|_{L^2_\mathbb{R}} < +\infty\},$$

where $\hat{f}$ is the Fourier transform of the function $f$. Thus, $H^0 = \dot{H}^0 = L^2_{\mathbb{R}}$, and this will be simply denoted as $L^2$. Sometimes we put an index $t$ or $x$ like $H^s_t$ or $\dot{H}^s_x$ to enlighten which variable concerns. For $\alpha \in \mathbb{R}$, $|\nabla|^\alpha$ denotes the Fourier multiplier with symbol $|\xi|^\alpha$. For $s \geq 0$, define $v \in H^s_I$ if, when $v(x)$ is extended to $\tilde{v}(x)$ on $\mathbb{R}$ by setting $\tilde{v}(x) = 0$ for $x \notin I$, then $\tilde{v} \in H^s$; in this case we set $\|v\|_{H^s_I} = \|\tilde{v}\|_{H^s}$. Finally, $\chi_I$ denotes the characteristic function for the interval $I \subset \mathbb{R}$.

The equation (1.1) has a scaling invariance: if $\psi(x,t)$ is a solution to (1.1) then $\lambda^{\frac{2}{p-1}} \psi(\lambda x, \lambda^2 t)$, $\lambda > 0$ is also. The scale-invariant Sobolev space for (1.1) is $H^\sigma$ with

$$\sigma_c = \frac{1}{2} - \frac{1}{p-1},$$

thus, for (1.1), $p = 3$ is the $L^2$ critical setting. If $p > 3$, then $0 < \sigma_c < \frac{1}{2}$ and

$$\frac{1}{4} < \frac{2\sigma_c + 1}{4} < \frac{1}{2}, \quad -\frac{1}{4} < \frac{2\sigma_c - 1}{4} < 0.$$

We take $q$ and $\tilde{q}$ to be given by

$$\frac{1}{q} = \frac{1}{2} - \frac{2\sigma_c + 1}{4}, \quad \frac{1}{2} = \frac{1}{\tilde{q}} - \frac{1 - 2\sigma_c}{4},$$

and from the definition of $\sigma_c$, we find that

$$q = 2(p - 1), \quad \tilde{q} = \frac{2(p - 1)}{p}.$$

In the remainder of the paper, once $p > 3$ is selected, we will take $\sigma_c$, $q$ and $\tilde{q}$ to have the corresponding values as defined above.

Recall that by Sobolev embedding, one has

$$\|\psi\|_{L^q_\mathbb{R}} \lesssim \|\psi\|_{H^2(2\sigma_c + 1)}, \quad \|f\|_{H^{-2\sigma_c - 1}} \lesssim \|f\|_{L^q_\mathbb{R}}.$$ 

More generally than the above case, $\sigma_c$ should satisfy $-\frac{1}{2} \leq \sigma_c < \frac{1}{2}$ to apply this Sobolev embedding, that is, the case $\sigma_c = 0$ (namely $p = 3$) is included for this embedding.
First, we recall here the local wellposedness result of (1.1) established in Theorem 1.1 of [11].

**Proposition 1.1.** Let $p > 1$ and $\psi_0 \in H^1$. Then, there exist $T^* > 0$ and a solution $\psi(x,t)$ to (1.1) on $[0,T^*)$ satisfying for $T < T^*$,

$$
\psi \in C^0_{[0,T]} H_x^1 \cap C^0_{\Omega} H^{\frac{3}{4}}(0,T),
$$

$$
\partial_x \psi \in C^0_{\mathbb{R}_x \setminus \{0\}} H^1(0,T).
$$

Here, the derivatives $\partial_x \psi(0^\pm,t) := \lim_{x \to \pm 0} \partial_x \psi(x,t)$, exist in the sense of $H^{\frac{3}{4}}(0,T)$ and $\psi$ satisfies

$$
\partial_x \psi(0^+,t) - \partial_x \psi(0^-,t) = -|\psi(0,t)|^{p-1}\psi(0,t)
$$

as an equality of $H^{\frac{3}{4}}(0,T)$ functions (not pointwisely in $t$).

Among all solutions satisfying the above regularity conditions, it is unique. Moreover, the data-to-solution map $\psi_0 \mapsto \psi$, as a map $H_x^1 \to C^0_{[0,T]} H_x^1$, is continuous, and if $T^* < +\infty$, then

$$
\lim_{t \uparrow T^*} \|\partial_x \psi(t)\|_{L^2} = +\infty.
$$

Hereafter, the solution to (1.1) satisfying the above regularity condition will be referred to as $H_x^1$ solution to (1.1).

The local virial identity has been also proved in [11]. For any smooth weight function $a(x)$ satisfying $a(0) = \partial_x a(0) = \partial_x^3 a(0) = 0$, the solution $\psi$ to (1.1) satisfies

$$
\partial_t^2 \int a(x)|\psi|^2 \, dx = 4 \int \partial_x^2 a|\partial_x \psi|^2 - 2\partial_x^2 a(0)|\psi(0)|^{p+1} - \int \partial_x^4 a|\psi|^2.
$$

**Proposition 1.2** ([11] Prop 1.3] sharp Gagliardo-Nirenberg inequality). For any $\psi \in H^1$,

$$
|\psi(0)|^2 \leq \|\psi\|_{L^2}\|\partial_x \psi\|_{L^2}.
$$

Equality is achieved if and only if there exist $\theta \in \mathbb{R}$, $\alpha > 0$ and $\beta > 0$ such that $\psi(x) = \alpha e^{i\theta} \varphi_0(\beta x)$, where $\varphi_0 = 2^{\frac{1}{p'\frac{1}{2}}} e^{-\frac{1}{|x|^2}}$ is the ground state solution to (1.1) (see [11]).

**Theorem 1.3** ([11] Prop 1.4] $L^2$ supercritical global existence/blow-up dichotomy). Suppose that $\psi(t)$ is an $H_x^1$ solution of (1.1) for $p > 3$ satisfying

$$
M(\psi_0)^{\frac{1-\sigma}{\sigma}} E(\psi_0) < M(\varphi_0)^{\frac{1-\sigma}{\sigma}} E(\varphi_0).
$$

Let

$$
\eta(t) = \frac{\|\psi(t)\|_{L^2}^{\frac{1-\sigma}{\sigma}} \|\partial_x \psi(t)\|_{L^2}}{\|\varphi_0\|_{L^2}^{\frac{1-\sigma}{\sigma}} \|\partial_x \varphi_0\|_{L^2}}
$$

Then
(1) If \( \eta(0) < 1 \), then the solution \( \psi(t) \) is global in both time directions and \( \eta(t) < 1 \) for all \( t \in \mathbb{R} \).

(2) If \( \eta(0) > 1 \), then the solution \( \psi(t) \) blows-up in the negative time direction at some \( T_- < 0 \), blows-up in the positive time direction at some \( T_+ > 0 \), and \( \eta(t) > 1 \) for all \( t \in (T_-, T_+) \).

Remark that if \( E(\psi_0) < 0 \), then the condition (1.4) is satisfied, and in that case \( \eta(t) > 1 \) is forced by (1.3), so the condition (2) applies giving the blow-up.

Main result of this paper is the following.

**Theorem 1.4.** (asymptotic completeness) Let \( p > 3 \). Let \( \psi_0 \in H^1 \) and let \( \psi(t) \) be a \( H^1_x \) solution of (1.1) satisfying

\[
M(\psi_0)^{1-\sigma_c \over \sigma_c} E(\psi_0) < M(\varphi_0)^{1-\sigma_c \over \sigma_c} E(\varphi_0)
\]

and

\[
\|\psi_0\|^{1-\sigma_c \over L^2} \|\varphi_0\|^{1-\sigma_c \over L^2} < \|\varphi_0\|^{1-\sigma_c \over L^2} \|\varphi_0\|^{1-\sigma_c \over L^2}.
\]

Then, there exist \( \psi^+, \psi^- \in H^1 \) such that

\[
\lim_{t \to \pm \infty} \| e^{-it\partial_x^2} \psi(t) - \psi^\pm \|_{H^1_x} = 0.
\]

We only consider the focusing nonlinearity, but the scattering for the defocusing case is similarly proved.

This paper is organized as follows: Below in Section 2, we will discuss the local theory, scattering criterion and long-time perturbation theory. Section 2 includes some preliminary and important results which reflect the smoothing properties of the equation (1.1). We will give in Section 3 the profile decomposition in \( H^1 \) in a form well-adapted to our equation. In Section 4, the asymptotic completeness in \( H^1 \) will be established using the results in Sections 2 and 3. We sometimes denote all through the paper by \( C_\theta,... \) a constant which depends on \( \theta \) and so on.

2. Local theory, scattering criterion, and long-time perturbation theory

Write the equation (1.1) in the Duhamel form:

\[
\psi(x, t) = e^{it\partial_x^2} \psi_0 + i \int_0^t e^{i(t-s)\partial_x^2} \delta(x) |\psi(x, s)|^{p-1} \psi(x, s) ds
\]

(2.1)

\[
= e^{it\partial_x^2} \psi_0 + i \int_0^t \frac{e^{it\partial_x^2}}{\sqrt{4\pi i(t-s)}} |\psi(0, s)|^{p-1} \psi(0, s) ds.
\]
We remark that the equation (1.1) is completely solved once the one-variable complex function \( \psi(0, \cdot) \) is known: indeed, specializing (2.1) to the value \( x = 0 \), one obtains a closed, nonlinear, integral, a Volterra-Abel type equation for \( \psi(0, \cdot) \):

\[
\psi(0, t) = \left[ e^{it\partial_x^2} \psi_0 \right](0) + i \int_0^t \frac{1}{\sqrt{4\pi i(t-s)}} |\psi(0, s)|^{p-1} \psi(0, s) ds.
\]

Now, for any \( \sigma \in \mathbb{R} \), we define for \( f \in \dot{H}^\sigma \), \( t, s \in \mathbb{R} \) with \( t \geq s \),

\[
[\mathcal{L}_s f](x, t) := \int_s^t \frac{e^{it\tau^2}}{\sqrt{4\pi i(t-\tau)}} f(\tau) d\tau.
\]

Similarly, we define, for \( t \in \mathbb{R} \),

\[
[\Lambda f](x, t) := \int_t^\infty \frac{e^{it\tau^2}}{\sqrt{4\pi i(t-\tau)}} f(\tau) d\tau.
\]

The following smoothing properties of \( \mathcal{L}_s \) and \( \Lambda \) will play important roles in what follows.

**Proposition 2.1.** Let \( \sigma \in \mathbb{R} \).

1. \( \| [e^{i(t-s)\partial_x^2} f](0) \|_{\dot{H}^{\sigma+1/4}} \lesssim \| f \|_{\dot{H}^\sigma} \), for any \( f \in \dot{H}^\sigma \) and \( t, s \in \mathbb{R} \).

2. Assume \( -\frac{1}{2} < \frac{2\sigma-1}{4} < \frac{1}{2} \). Let \( f \in \dot{H}^{2\sigma-1/4} \) and \( s \in \mathbb{R} \).
   - (2a) \( \| [\mathcal{L}_s f](0, \cdot) \|_{\dot{H}^{\sigma+1/4}} \lesssim \| \chi_{[s, \infty)} f \|_{\dot{H}^{2\sigma-1/4}} \lesssim \| f \|_{\dot{H}^{2\sigma-1/4}} \)
   - (2b) \( \| [\Lambda f](0, \cdot) \|_{\dot{H}^{2\sigma+1/4}} \lesssim \| f \|_{\dot{H}^{2\sigma-1/4}} \)

3. Assume \( -\frac{1}{2} < \frac{2\sigma-1}{4} < \frac{1}{2} \). Let \( f \in \dot{H}^{2\sigma+1/4} \) and \( s \in \mathbb{R} \).
   - (3a) \( \| \mathcal{L}_s f \|_{L^\infty_t \dot{H}^\sigma} \lesssim \| f \|_{\dot{H}^{2\sigma+1/4}} \)
   - (3b) \( \| \Lambda f \|_{L^\infty_t \dot{H}^\sigma} \lesssim \| f \|_{\dot{H}^{2\sigma-1/4}} \)

For the proof of Proposition 2.1 we need some preparations.

**Lemma 2.2.** For any \( -\frac{1}{2} < \mu < \frac{1}{2} \), and any \( t > 0 \), we have

\[
\| \chi_{[0, t]} f \|_{\dot{H}^\mu} \lesssim \| f \|_{\dot{H}^\mu}
\]

with implicit constant independent of \( t \).

**Proof.** First, we claim that it suffices to show

\[
\| \chi_{[0, \infty)} f \|_{\dot{H}^\mu} \lesssim \| f \|_{\dot{H}^\mu}
\]
Indeed, suppose that we have proved (2.4). Since \( \chi_{[0,t]} = \chi_{[0,\infty)} \chi_{(-\infty,t]} \), to prove (2.3) we note
\[
\| \chi_{[0,t]} f \|_{\dot{H}^s} = \| \chi_{[0,\infty)} \chi_{(-\infty,t]} f \|_{\dot{H}^s}
\]
\[
\lesssim \| \chi_{(-\infty,t]} f \|_{\dot{H}^s}
\]
by (2.4)
\[
= \| \chi_{[0,\infty)} \check{f} \|_{\dot{H}^s}
\]
where \( \check{f}(s) = f(-s+t) \). In the last step, we have used that
\[
[\chi_{(-\infty,t]}(s) f(s)]^\wedge (\tau) = e^{-it\tau}[\chi_{[0,\infty)}(s) f(-s+t)]^\wedge (-\tau)
\]
We continue and apply (2.4) to obtain
\[
\| \chi_{[0,\infty)} \check{f} \|_{\dot{H}^s} \lesssim \| \check{f} \|_{\dot{H}^s} = \| f \|_{\dot{H}^s}
\]
where, in the last step, we used that \( \hat{\check{f}}(\tau) = e^{-it\tau} \hat{f}(-\tau) \). This completes the proof of (2.3) assuming (2.4).

To prove (2.4), we note \( \hat{\chi}_{[0,\infty)}(\tau) = \text{pv} \frac{1}{i\tau} + \pi \delta(\tau) \) and thus
\[
[\chi_{[0,\infty)} f]^\wedge (\tau) = \pi (H \hat{f} + \hat{f})
\]
where \( H \) denotes the Hilbert transform. Hence
\[
\| \chi_{[0,\infty)} f \|_{\dot{H}^s} = \| |\tau|^\mu [\chi_{[0,\infty)} f]^\wedge (\tau) \|_{L^2}\n\]
\[
\lesssim \| |\tau|^\mu (H \hat{f})(\tau) \|_{L^2} + \| |\tau|^\mu \hat{f}(\tau) \|_{L^2}
\]
Since \(-\frac{1}{2} < \mu < \frac{1}{2}\), we can apply Corollary of Theorem 2 on page 205 in [18], combined with (6.4) on p. 218 of [18] (for \( p = 2, n = 1, a = 2\mu \)) to estimate the above as
\[
\| \chi_{[0,\infty)} f \|_{\dot{H}^s} \lesssim \| |\tau|^\mu \hat{f} \|_{L^2} = \| f \|_{\dot{H}^s}.
\]

\[\Box\]

**Proof.** (of Proposition 2.1) (1) was already proved in Lemma 1 of [3], but for the sake of completeness we give a proof. We use here the notation \( \hat{\cdot} \), which means the Fourier transform in space, and \( \mathcal{F} \) is in time. It suffices to show the case \( s = 0 \). Since the free Schrödinger group is unitary in \( \dot{H}^{\sigma}_x \) for any \( \sigma \in \mathbb{R} \), We may write
\[
[e^{it\partial^2_x} f](0) = \int_{\mathbb{R}_\xi} e^{-ik^2 t} \hat{f}(\xi) d\xi.
\]
By a change of variables this equals
\[
\int_0^{+\infty} e^{-ikt} \frac{\hat{f}(-\sqrt{k}) + \hat{f}(\sqrt{k})}{2\sqrt{k}} dk.
\]
Thus the Fourier transform in time gives
\[
\mathcal{F}[(e^{it\partial^2_x} f)(0)](\omega) = 2\pi \frac{\hat{f}(-\sqrt{\omega}) + \hat{f}(\sqrt{\omega})}{2\sqrt{\omega}} \chi_{[0,\infty)}(\omega).
\]
Therefore
\[
\|e^{it\partial_x^2}f(0)\|_{H^s}^2 = \pi^2 \int_{\mathbb{R}} |\omega|^{2s-1} |\hat{f}(-\sqrt{\omega}) + \hat{f}(\sqrt{\omega})|^2 \chi_{[0, +\infty)}(\omega) d\omega \\
\leq 2\pi^2 \int_{\mathbb{R}} |k|^{2s-1} |\hat{f}(k)|^2 dk \\
= C\|f\|_{\dot{H}^{4s-1}},
\]
where, again we changed the variables \(\pm \sqrt{\omega} = k\) in the second inequality. For (2a), we may write
\[
[L_s f](0, t) = \int_s^t \frac{f(\tau)}{\sqrt{4\pi i(t-\tau)}} d\tau \\
= \frac{1}{\sqrt{4\pi i}} \int_{-\infty}^{t-\infty} (t-\tau)_+^{-\frac{1}{2}} \chi_{[s, \infty)}(\tau) f(\tau) d\tau = \frac{1}{\sqrt{4\pi i}} (t_{-\frac{1}{2}}^{-\frac{1}{2}} \star \chi_{[s, +\infty)} f)(t),
\]
where
\[
t_{-\frac{1}{2}} := \begin{cases} 
  t_{-\frac{1}{2}}, & t > 0 \\
  0, & t \leq 0
\end{cases}
\]
\[
t_{-\frac{1}{2}}(\xi) = (i\xi)^{-\frac{1}{2}} \Gamma \left(\frac{1}{2}\right).
\]
We operate the Fourier transform and obtain
\[
[L_s f](0, \cdot)(\xi) = \left(\frac{i\xi}{\sqrt{4i}}\right)^{-\frac{1}{2}} \chi_{[s, \infty)} \hat{f}(\xi).
\]
It thus follows that by Lemma 2.2 for \(-\frac{1}{2} < \frac{2s-1}{4} < \frac{1}{2}\),
\[
\|L_s f\|_{\dot{H}^{2s+1}}^2 \leq C\|\chi_{[s, +\infty)} f\|_{\dot{H}^{2s-1}}^2 \leq C\|f\|_{\dot{H}^{2s-1}}^2.
\]
The proof of (2b) is similar, since
\[
[\Lambda f](0, t) = \frac{-i}{\sqrt{4\pi i}} ((-t)_{+}^{-\frac{1}{2}} \star f)(t).
\]
For (3a), it suffices to prove that for any \(g \in \dot{H}_x^{-\sigma}(\mathbb{R})\) with \(\|g\|_{\dot{H}_x^{-\sigma}} = 1\),
\[
\langle L_s f, g \rangle \leq \|f\|_{\dot{H}_x^{2s-1}}.
\]
The left hand side can be estimated as follows.
\[
\langle L_s f, g \rangle = \frac{1}{\sqrt{4\pi i}} \int_{-\infty}^{+\infty} \chi_{[s, \xi]}(\tau) f(\tau) \left|e^{i(t-\tau)\partial_x^2} \hat{g}(0)\right| d\tau \\
\leq C\|\chi_{[s, \xi]} f\|_{\dot{H}_x^{2s-1}} \|\left|e^{i(t-\tau)\partial_x^2} \hat{g}(0)\right|\|_{\dot{H}_x^{2s-1}} \\
\leq C\|f\|_{\dot{H}_x^{2s-1}} \|g\|_{\dot{H}_x^{-\sigma}}
\]
where we have used (1) with the unitary property of free Schrödinger group in \(\dot{H}_x^s\) for any \(s \in \mathbb{R}\), and Lemma 2.2 in the last inequality. Since (3b) can be similarly proved,
we omit the proof, but we remark that for any $\sigma \in \mathbb{R}$, (that is, without the restriction $-\frac{1}{2} < \frac{2\sigma - 1}{4} < \frac{1}{2}$),

\begin{equation}
\|\Lambda f\|_{\dot{H}^{\sigma}_2} \lesssim \|\chi_{[t, +\infty)} f\|_{\dot{H}^{2\sigma - 1}}.
\end{equation}

holds. \hfill \Box

From now on, we prepare some basic facts in order to prove the asymptotic completeness. For the sake of simplicity we will study the following Propositions 2.3–2.5 only in the case $t > 0$, but we can consider the negative time $t < 0$ similarly.

**Proposition 2.3** (small data global well-posedness). Let $p \geq 3$. There exists $\delta_{sd} > 0$ such that if $\psi_0 \in \dot{H}^{\sigma_c}$ and $\|e^{it\partial_x^2} \psi_0\|_{L^q_{t>0}} \leq \delta_{sd}$, then $\psi \in \dot{H}^{\sigma_c}$ solving (1.1) is global in $\dot{H}^{\sigma_c}$ and

$$
\|\psi(0, t)\|_{L^q_{t>0}} \leq 2\|e^{it\partial_x^2} \psi_0\|_{L^q_{t>0}},
$$

$$
\|\psi(x, t)\|_{C^0_{[0, \infty)} H^{\sigma_c}_2} \leq 2\|\psi_0\|_{\dot{H}^{\sigma_c}}.
$$

(Note that by Proposition 2.1 (1) and Sobolev embedding, the smallness assumption $\|e^{it\partial_x^2} \psi_0\|_{L^q_{t>0}} \leq \delta_{sd}$ is satisfied if $\|\psi_0\|_{\dot{H}^{\sigma_c}} \leq C\delta_{sd}$.)

**Proof.** Define a map: for a $\psi_0 \in \dot{H}^{\sigma_c}$ given,

$$
\mathcal{T}_{\psi_0}(t) := [e^{it\partial_x^2} \psi_0](0) + i[L_0(|\psi|^{p-1} \psi)](t).
$$

By Proposition 2.1 and Sobolev embedding, we have

$$
\|\mathcal{T}_{\psi_0}(t)\|_{L^q_{t>0}} \leq \||e^{it\partial_x^2} \psi_0\|_{L^q_{t>0}} + \|L_0(|\psi|^{p-1} \psi)(0, \cdot)\|_{L^q_{t>0}}
$$

$$
\leq \||e^{it\partial_x^2} \psi_0\|_{L^q_{t>0}} + C\|L_0(|\psi|^{p-1} \psi)(0, \cdot)\|_{\dot{H}^{2\sigma_c-1}_t}
$$

$$
\leq \||e^{it\partial_x^2} \psi_0\|_{L^q_{t>0}} + C\|\psi(0, \cdot)\|_{L^q_{t>0}}.
$$

Let

$$
B := \{\phi \in L^q_{t>0} : \|\phi\|_{L^q_{t>0}} \leq 2\|e^{it\partial_x^2} \psi_0\|_{L^q_{t>0}}\}.
$$

If $\|e^{it\partial_x^2} \psi_0\|_{L^q_{t>0}} \leq \delta_{sd}$ then $\mathcal{T}_{\psi_0} \psi \in B$ for any $\psi \in B$, taking $\delta_{sd}$ sufficiently small.

The difference $\|\mathcal{T}_{\psi_0}(t) - \mathcal{T}_{\bar{\psi}_0}(t)\|_{L^q_{t>0}}$ is similarly estimated by

$$
\||\mathcal{T}_{\psi_0}(|\psi|^{p-1} \psi - |\bar{\psi}|^{p-1} \bar{\psi})(\cdot)\|_{L^q_{t>0}} \leq C(|\psi|_{L^q_{t>0}}^{p-1} + |\bar{\psi}|_{L^q_{t>0}}^{p-1})\|\psi - \bar{\psi}\|_{L^q_{t>0}}
$$

for $\psi, \bar{\psi} \in B$. Again taking $\delta_{sd}$ sufficiently small, we conclude that $\mathcal{T}_{\psi_0}$ is a contraction on $B$. There thus exists a unique solution $\tilde{\psi} \in B$ such that $\mathcal{T}_{\psi_0}\tilde{\psi} = \psi$. 

For the last inequality in the proposition, we use Eq. (2.1) for the unique solution \( \tilde{\psi} \) obtained above in \( B \). Inserting \( \tilde{\psi} \) as the value of \( \psi(0, t) \) at time \( t \) in the RHS of (2.1), the values of \( \psi(x, t) \) for any \( x \) can be expressed as

\[
\psi(x, t) = e^{it\partial_x^2} \psi_0 + i \int_0^t \frac{e^{is\partial_x^2}}{\sqrt{4\pi i(t-s)}} |\psi(0, s)|^{p-1} \psi(0, s) ds,
\]

with \( \psi(0, \cdot) \in B \). Then, Sobolev embedding and Proposition 2.1 implies

\[
\|\psi\|_{\dot{H}^{s_c}_x} \leq \|e^{it\partial_x^2} \psi_0\|_{\dot{H}^{s_c}_x} + \|L_0(|\psi|^p\psi)(\cdot, t)\|_{\dot{H}^{s_c}_x} \\
\leq \|e^{it\partial_x^2} \psi_0\|_{\dot{H}^{s_c}_x} + C\|\chi_{[0,1]}|\psi|^{p-1}\psi\|_{L^p_x}^p \\
\leq \|\psi_0\|_{\dot{H}^{s_c}_x} + C\|\chi_{[0,1]}|\psi|^{p-1}\psi\|_{L^p_x}^p \leq \|\psi(0, \cdot)\|_{L^p_{t>0}}.
\]

(2.6)

Since \( \psi(0, \cdot) \in B \) with \( \|e^{it\partial_x^2} \psi_0\|_{L^p_{t>0}} \leq \delta_{sd} \), by Sobolev embedding and Proposition 2.1, 1,

\[
\|\psi(0, \cdot)\|_{L^p_{t>0}} \leq 2^p \delta_{sd}^{-1} \|e^{it\partial_x^2} \psi_0(0)\|_{L^q_x} \leq 2^p \delta_{sd}^{-1} \|e^{it\partial_x^2} \psi_0(0)\|_{\dot{H}^{s_c}_x}^2 \leq 2^p \delta_{sd}^{-1} \|\psi_0\|_{\dot{H}^{s_c}_x}.
\]

Taking \( \delta_{sd} \) sufficiently small, the RHS of (2.6) is bounded by \( 2\|\psi_0\|_{\dot{H}^{s_c}_x} \). Note that the time continuity property follows from the fundamental solution, and this concludes

\[
\|\psi(x, t)\|_{C^0_{[0,\infty]\dot{H}^{s_c}_x}} \leq 2\|\psi_0\|_{\dot{H}^{s_c}_x}.
\]

\[ \square \]

**Proposition 2.4** (scattering criterion). Let \( p \geq 3 \). Suppose that \( \psi_0 \in H^1 \) and \( \psi \in H^1_x \) solving (1.1) is forward global with

\[
\|\psi(0, \cdot)\|_{L^q_{t>0}} < \infty
\]

and with a uniform \( H^1_x \) bound

\[
\sup_{t \geq 0} \|\psi(\cdot, t)\|_{H^1_x} \leq B.
\]

Then \( \psi(t) \) scatters in \( H^1_x \) as \( t \nearrow +\infty \). This means that there exists \( \psi^+ \in H^1_x \) such that

\[
\lim_{t \searrow +\infty} \|\psi(t) - e^{it\partial_x^2} \psi^+\|_{H^1_x} = 0.
\]

**Proof.** Using the equation (2.1), we may write

\[
\psi(t) - e^{it\partial_x^2} \psi^+ = -i \int_t^{+\infty} e^{i(s-t)\partial_x^2} \delta(x)|\psi(s)|^{p-1} \psi(s) ds,
\]

where

\[
\psi^+ := \psi_0 + i \int_0^{+\infty} e^{-is\partial_x^2} \delta(x)|\psi(s)|^{p-1} \psi(s) ds.
\]
Therefore,
\[
\|\psi(t) - e^{it\partial^2_x} \psi^+\|_{H^1_x} = \| \int_t^{\pm \infty} e^{i(t-s)\partial^2_x} \delta(x)|\psi(s)|^{p-1}\psi(s) ds \|_{H^1_x} = \| \Lambda(|\psi|^{p-1}\psi)(\cdot, t) \|_{H^1_x}.
\]

Thus we shall estimate \(\|\Lambda(|\psi|^{p-1}\psi)(\cdot, t)\|_{L^2_x}\) and \(\|\Lambda(|\psi|^{p-1}\psi)(\cdot, t)\|_{H^1_x}\). First, \(\|\Lambda(|\psi|^{p-1}\psi)(\cdot, t)\|_{L^2_x}\) is estimated by (3b) of Proposition 2.1 and the Sobolev embedding as follows. For any \(t > 0\),
\[
\|\Lambda(|\psi|^{p-1}\psi)(\cdot, t)\|_{L^2_x} \leq \|\chi_{[t, +\infty)}|\psi|^{p-1}\psi\|_{H^{-\frac{1}{4}}}
\]
\[
\leq C\|\chi_{[t, +\infty)}|\psi|^{p-1}\psi\|_{L^\frac{8}{3}}
\]
\[
(2.8)
\]

Second, by the Sobolev embedding and fractional chain rule [8], for any \(t > 0\),
\[
\|\Lambda(|\psi|^{p-1}\psi)(\cdot, t)\|_{H^1_x} \leq C\|\chi_{[t, +\infty)}|\psi|^{p-1}\psi\|_{H^\frac{1}{4}}
\]
\[
\leq C\|\chi_{[t, +\infty)}|\psi|^{p-1}\psi\|_{L^\frac{8}{3}} \|\nabla \frac{1}{4}\chi_{[t, +\infty)}\psi\|_{L^\frac{16}{9}}
\]
\[
(2.9)
\]

with \(\frac{1}{2} = \frac{1}{r_1} + \frac{1}{r_2}\), \(1 < r_1, r_2 < +\infty\). Taking \(q < r_1 < +\infty\) and \(2 < r_2 < 4\), by interpolation,
\[
\|\chi_{[t, +\infty)}|\psi|^{p-1}\|_{L^\frac{8}{3}} \leq C\|\psi\|_{L^\frac{8}{3}} \sup_{s \geq t} |\psi(0, s)|^{\left(1 - \frac{4}{r_1}\right)}
\]
\[
\leq C\|\psi\|_{L^\frac{8}{3}} \sup_{s \geq t} \|\psi(s)\|_{L^\frac{\infty}{r_2}}^{\left(1 - \frac{4}{r_1}\right)}
\]
\[
\leq C\|\psi\|_{L^\frac{8}{3}} \sup_{s \geq t} \|\psi(s)\|_{H^\frac{1}{4}}^{\left(1 - \frac{4}{r_1}\right)} \leq C_B \|\psi\|_{L^\frac{8}{3}}
\]

where we have used the Sobolev embedding \(H^1(\mathbb{R}_+) \subset L^\infty(\mathbb{R}_+)\). Again by interpolation
\[
\|\nabla \frac{1}{4}\chi_{[t, +\infty)}\psi\|_{L^\frac{16}{9}} \leq \|\chi_{[t, +\infty)}\psi\|_{H^\frac{1}{4}} \|\nabla \frac{1}{4}\chi_{[t, +\infty)}\psi\|_{L^\infty}^{\left(1 - \frac{4}{r_2}\right)}
\]
\[
\leq C\|\chi_{[t, +\infty)}\psi\|_{H^\frac{1}{4}} \left(\|\chi_{[t, +\infty)}\psi\|_{H^\frac{1}{4}} + \|\chi_{[t, +\infty)}\psi\|_{H^\frac{1}{4}}\right)^{\left(1 - \frac{4}{r_2}\right)}
\]

where we have used the Sobolev embedding \(H^1(\mathbb{R}_+) \subset L^\infty(\mathbb{R}_+)\) in the second inequality. We go back to the equation (2.7), evaluating at \(x = 0\), to estimate
\[
\|\chi_{[t, +\infty)}\psi\|_{H^\frac{1}{4}} \leq \|\chi_{[t, +\infty)}e^{it\partial^2_x} \psi^+(0)\|_{H^\frac{1}{4}} + \|\chi_{[t, +\infty)}\Lambda(|\psi|^{p-1}\psi)(0, \cdot)\|_{H^\frac{1}{4}}
\]
\[
\leq \|\psi^+\|_{L^2} + \|\chi_{[t, +\infty)}\psi\|^{p-1}\psi\|_{H^{-\frac{1}{4}}}
\]
\[
\leq \|\psi^+\|_{L^2} + \|\psi\|_{L^q}^{p},
\]
and
\[
\|X_{[t, +\infty)}\psi\|_{H^{\frac{4}{3}}} \leq \|X_{[t, +\infty)}e^{it\partial_x^2}\psi^+\|_{H^{\frac{4}{3}}} + \|X_{[t, +\infty)}A(|\psi|^{p-1}\psi)(0, \cdot)\|_{H^{\frac{4}{3}}}
\]
\[
\leq \|\psi^+\|_{H^{\frac{4}{3}}} + \|X_{[t, +\infty)}|\psi|^{p-1}\psi\|_{H^{\frac{4}{3}}}.
\]
Note that we used Lemma 2.2 and Proposition 2.1 (2b). Plugging these results into (2.9), we see that for \( t > 0 \) sufficiently large, \( \|X_{[t, +\infty)}|\psi|^{p-1}\psi\|_{H^{\frac{4}{3}}} \) is small. This completes the proof combining with (2.8).

□

**Proposition 2.5** (long-time perturbation theory). Let \( p \geq 3 \). For each \( A \gg 1 \), there exists \( \epsilon_0 = \epsilon_0(A) \ll 1 \) and \( c = c(A) \gg 1 \) such that the following holds. Let \( \psi \in H^{1}_x \) for all \( t \) solving

\[
i\partial_t \psi + \partial_x^2 \psi + \delta |\psi|^{p-1}\psi = 0.
\]
Let \( \tilde{\psi} \in H^{1}_x \) for all \( t \) and suppose that there exists \( e \in L^q_t \) such that

\[
i\partial_t \tilde{\psi} + \partial_x^2 \tilde{\psi} + \delta (|\tilde{\psi}|^{p-1}\tilde{\psi} - e) = 0.
\]
If

\[
\|\tilde{\psi}(0, \cdot)\|_{L^q_t} \leq A, \quad \|e(0, \cdot)\|_{L^q_t} \leq \epsilon_0
\]
and

\[
\|[e^{i(t-t_0)\partial_x^2}(\psi(t_0) - \tilde{\psi}(t_0))](0)\|_{L^q_t} \leq \epsilon_0
\]
for some \( t_0 \geq 0 \), then

\[
\|\psi(0, \cdot)\|_{L^q_t} \leq c = c(A) < \infty.
\]

**Proof.** Put \( w = \psi - \tilde{\psi} \). Then \( w \) satisfies

\[
i\partial_t w + \partial_x^2 w + W = 0,
\]
where

\[
W = \delta (|\tilde{\psi} + w|^{p-1}(\tilde{\psi} + w) - |\tilde{\psi}|^{p-1}\tilde{\psi} + e).
\]
Since \( \|\tilde{\psi}(0, \cdot)\|_{L^q_t} \leq A \), there exists a \( N = N(A) \) so that the interval \([t_0, +\infty)\) may be divided into the sum of \( N(A) \) intervals. Namely, \([t_0, +\infty) = \cup_{j=1}^{N(A)} I_j \) with \( I_j = [t_j, t_{j+1}] \) \((j = 0, 1, 2, \ldots)\) so that \( \|\tilde{\psi}(0, \cdot)\|_{L^q_t} \leq \eta \) (\( \eta \) is small to be determined later). Let \( t \in I_j \). Write the equation (2.10) in the integral form.

\[
w(t) = e^{i(t-t_j)\partial_x^2} w(t_j) + i \int_{t_j}^{t} e^{i(t-s)\partial_x^2} W(s) ds.
\]
We estimate the time \( L^q \) norm of \( w \) evaluated at \( x = 0 \).

\[
\|w(0, \cdot)\|_{L^q_t} \leq \|[e^{i(t-t_j)\partial_x^2} w(t_j)](0)\|_{L^q_t} + \left\| \int_{t_j}^{t} e^{i(t-s)\partial_x^2} W(s) ds \right\|_{L^q_t}.
\]
The last term can be written as, taking into account for the delta potential in $W$,
\[
\left\| \int_{t_j}^{t} e^{i(t-s)\partial_x^2} W(s) ds \right\|_{L^q_j} = \left\| [\mathcal{L}_{t_j} (|\tilde{\psi} + w|^{p-1}(\tilde{\psi} + w)(0, \cdot) - |\tilde{\psi}|^{p-1}\tilde{\psi}(0, \cdot) + e(\cdot))] (0, \cdot) \right\|_{L^q_j},
\]
and then we estimate as follows.
\[
\begin{align*}
\left\| [\mathcal{L}_{t_j} (|\tilde{\psi} + w|^{p-1}(\tilde{\psi} + w) - |\tilde{\psi}|^{p-1}\tilde{\psi} + e)] (0, \cdot) \right\|_{L^q_j} &
\leq C \left\| [\tilde{\psi} + w|^{p-1}(\tilde{\psi} + w) - |\tilde{\psi}|^{p-1}\tilde{\psi}] \right\|_{L^q_j} + \| e \|_{L^q_j} \\
&
\leq C (\|\tilde{\psi}|^{p-1}w(0, \cdot)\|_{L^q_j} + \|w^p(0, \cdot)\|_{L^q_j}) + \|e\|_{L^q_j},
\end{align*}
\]

where, in the first inequality, we have used, by density of $C_0^\infty (I_j) \subset L^q(I_j)$, Sobolev embedding, and Proposition 2.1 (2a).

The first term of RHS is estimated by H"older inequality as follows.
\[
\|\tilde{\psi}|^{p-1}w(0, \cdot)\|_{L^q_j} \leq \|\tilde{\psi}(0, \cdot)\|_{L^q_j}^{p-1} \|w(0, \cdot)\|_{L^q_j}.
\]

Thus, we have
\[
\|w(0, \cdot)\|_{L^q_j} \leq \|[e^{i(t-t_j)\partial_x^2} w(t_j)](0)\|_{L^q_j} + C\eta \|w(0, \cdot)\|_{L^q_j} + C\|w(0, \cdot)\|_{L^q_j} + C\epsilon_0.
\]

We then obtain
\[
(2.12) \quad \|w(0, \cdot)\|_{L^q_j} \leq 2\|[e^{i(t-t_j)\partial_x^2} w(t_j)](0)\|_{L^q_j} + 2C\epsilon_0,
\]

provided
\[
\eta < \left( \frac{1}{2C} \right)^{\frac{1}{p-1}}
\]

and
\[
(2.13) \quad \|[e^{i(t-t_j)\partial_x^2} w(t_j)](0)\|_{L^q_j} + C\epsilon_0 \leq \left( \frac{1}{2C} \right)^{\frac{1}{p-1}}.
\]

Now take $t = t_{j+1}$ in (2.11), apply $e^{i(t-t_{j+1})\partial_x^2}$ to both hands,
\[
e^{i(t-t_{j+1})\partial_x^2} w(t_{j+1}) = e^{i(t-t_j)\partial_x^2} w(t_j) + i \int_{t_j}^{t_{j+1}} e^{i(t-s)\partial_x^2} W(s) ds,
\]

and we take $L^q(\mathbb{R}_t)$ norm of this equation after evaluating at $x = 0$,
\[
\|[e^{i(t-t_{j+1})\partial_x^2} w(t_{j+1})](0)\|_{L^q_{kt}} \leq \|[e^{i(t-t_j)\partial_x^2} w(t_j)](0)\|_{L^q_{kt}} + C\eta \|w(0, \cdot)\|_{L^q_j} + C\|w(0, \cdot)\|_{L^q_j} + C\epsilon_0.
\]
Thus, by (2.12),
\[
\| [e^{i(t-t_j+1)\partial^2_x}w(t_{j+1})](0) \|_{L^q_{R^t}} \leq 2 \| [e^{i(t-t_j)\partial^2_x}w(t_j)](0) \|_{L^q_{R^t}} + 2C\epsilon_0.
\]
Iterating this inequality starting from \( j = 0 \), we have
\[
\| [e^{i(t-t_j)\partial^2_x}w(t_j)](0) \|_{L^q_{R^t}} \leq 2^{j+2}C\epsilon_0.
\]
To satisfy (2.13) for all \( I_j \) with \( 0 \leq j \leq N-1 \), we require \( \epsilon_0 = \epsilon_0(N) \) to be sufficiently small such that
\[
2N+2C\epsilon_0 < \left( \frac{1}{2C} \right)^{p-1} (i.e. \epsilon_0 \text{ needs to be taken in terms of } A),
\]
and we obtain
\[
\| \psi_n(0, t) \|_{L^q_{R^t} > 0} \leq c = c(A).
\]
\[\square\]

3. Profile decomposition

**Proposition 3.1** (profile decomposition). Let \( p \geq 3 \). Suppose that \( \{\psi_n\} \) is a uniformly bounded sequence in \( H^1 \). Then for each \( M \), there exists a subsequence of \( \{\psi_n\} \) and

1. for each \( 1 \leq j \leq M \), there exists a (fixed in \( n \)) profile \( \phi^j \in H^1 \)
2. for each \( 1 \leq j \leq M \), there exists a sequence (in \( n \)) of time shifts \( t^j_n \)
3. there exists a sequence (in \( n \)) of remainders \( w^M_n(x) \) in \( H^1 \) such that

\[
\psi_n = \sum_{j=1}^M e^{-it^j_n \partial^2_x} \phi^j + w^M_n
\]
The time sequences have a pairwise divergence property: for \( 1 \leq i \neq j \leq M \), we have
\[
\lim_{n \to \infty} |t^i_n - t^j_n| = +\infty.
\]
The remainder sequence \( \{w^M_n\} \) has the following asymptotic smallness property
\[
\lim_{M \to \infty} \left[ \lim_{n \to \infty} \| [e^{it\partial^2_x} w^M_n](0) \|_{L^q_{R^t}} \right] = 0.
\]
For fixed \( M \) and any \( 0 \leq \sigma_c \leq 1 \), we have the asymptotic \( H^{\sigma_c} \) decoupling
\[
\| \psi_n \|^2_{H^{\sigma_c}} = \sum_{j=1}^M \| \phi^j \|^2_{H^{\sigma_c}} + \| w^M_n \|^2_{H^{\sigma_c}} + o_n(1),
\]
also we have
\[
|\psi_n(0)|^{p+1} = \sum_{j=1}^M |[e^{-it^j_n \partial^2_x} \phi^j](0)|^{p+1} + |w^M_n(0)|^{p+1} + o_n(1).
\]
Proof. For $R > 0$, let $\chi_R(\xi)$ be a smooth cutoff to $R^{-1} < |\xi| < R$. Let $A = \limsup_{n \to \infty} \|\psi_n\|_{H^1_x}$ and $B_1 = \lim_{n \to \infty} \|[e^{it\partial_x^2} \psi_n](0)\|_{L_{t\xi}^q}$. If $B_1 = 0$, the proof is done. Let $B_1 > 0$. Since for $0 \leq \sigma_c \leq 1$,

$$\int_{|\xi| < R^{-1}} |\hat{\psi}_n(\xi)|^2 |\xi|^{2\sigma_c} \, d\xi \leq R^{-2\sigma_c} \|\psi_n\|_{L^2_x}^2 \leq A^2 R^{-2\sigma_c},$$

$$\int_{|\xi| > R} |\hat{\psi}_n(\xi)|^2 |\xi|^{2\sigma_c} \, d\xi \leq R^{2(\sigma_c - 1)} \|\psi_n\|_{H^1}^2 \leq A^2 R^{2(\sigma_c - 1)}.$$

We may take a $R_1$ large enough so that $AR_1^{-\sigma_c} \leq B_1/2$ and $AR_1^{\sigma_c - 1} \leq B_1/2$, specifically $R_1 = (2B_1^{-1}) \max(\frac{1}{\sigma_c}, \frac{1}{1-\sigma_c})$ so that

$$\lim_{n \to \infty} \|[e^{it\partial_x^2} (\delta - \check{\chi}_{R_1}) * \psi_n](0)\|_{L_{t\xi}^q} \leq \frac{1}{2} B_1.$$

It thus follows, using Proposition 2.1(1),

$$\left(\frac{1}{2} B_1\right)^q \leq \lim_{n \to \infty} \|[\check{\chi}_{R_1} * e^{it\partial_x^2} \psi_n](0)\|_{L_{t\xi}^q}^q \leq \lim_{n \to \infty} \|[\check{\chi}_{R_1} * e^{it\partial_x^2} \psi_n](0)\|_{L_{t\xi}^q}^2 \|[\check{\chi}_{R_1} * e^{it\partial_x^2} \psi_n](0)\|_{L_{t\xi}^q}^{q-2}.$$

For the factor $\|[\check{\chi}_{R_1} * e^{it\partial_x^2} \psi_n](0)\|_{L_{t\xi}^q}^2$, we use again the smoothing estimate of Proposition 2.1(1) to bound by

$$\|\check{\chi}_{R_1} * \psi_n\|_{H^{1/2}}^2 \leq R_1 \|\check{\chi}_{R_1} * \psi_n\|_{L^2}^2 \leq R_1 A^2.$$

Thus, we see $\lim_{n \to \infty} \|[\check{\chi}_{R_1} * e^{it\partial_x^2} \psi_n](0)\|_{L_{t\xi}^q} > (R_1 A^2)^{-\frac{1}{q-2}} (B_1/2)^{\frac{q}{q-2}}$, and we take a sequence $\{t_n^1\}$ such that

$$[\check{\chi}_{R_1} * e^{it\partial_x^2} \psi_n](0, t_n^1) = \int \check{\chi}_{R_1} (-y) (e^{it_n^1 \partial_x^2} \psi_n)(y) \, dy,$$

and

$$(3.3) \quad \frac{1}{2} (R_1 A^2)^{-\frac{1}{q-2}} \left(\frac{B_1}{2}\right)^{\frac{q}{q-2}} \leq \left| \int \check{\chi}_{R_1} (-y) e^{it_n^1 \partial_x^2} \psi_n(y) \, dy \right|.$$

Consider the sequence $\{e^{it_n^1 \partial_x^2} \psi_n\}_n$, which is uniformly bounded in $H^1_x$, and pass to subsequence such that $e^{it_n^1 \partial_x^2} \psi_n$ converges weakly in $H^1_x$ to some $\phi^1 \in H^1$. By Cauchy-Schwarz inequality, using that $\|\check{\chi}_{R_1}\|_{H^{-\sigma_c}} \lesssim R_1^{\frac{1}{2}-\sigma_c}$ and (3.3),

$$\|\phi^1\|_{H^{\sigma_c}} \geq (R_1^{\frac{1}{2}-\sigma_c})^{-1} (R_1 A^2)^{-\frac{1}{q-2}} \left(\frac{B_1}{2}\right)^{\frac{q}{q-2}} \frac{1}{2}.$$

Then for any $0 \leq \sigma_c \leq 1$,

$$\lim_{n \to \infty} \|\psi_n - e^{-it_n^1 \partial_x^2} \phi^1\|_{H^{\sigma_c}}^2 = \|\psi_n\|_{H^{\sigma_c}}^2 - \|\phi^1\|_{H^{\sigma_c}}^2.$$
If \( |t_n^1| \to +\infty \), since \( \|e^{-i t_n^1 \partial_x^2} \phi^1\| L^\infty_x \leq \|\phi^1\| H^2_x \), possibly taking a subsequence, we have \( \|e^{-i t_n^1 \partial_x^2} \phi^1\| L^q_x \to 0 \) as \( n \to +\infty \). On the other hand, since \( \psi_n \) is uniformly bounded in \( H^1_x \), there is a weak limit \( \psi \in H^1_x \) and \( \psi_n(0) \to \psi(0) \) as \( n \to \infty \) by Proposition 4.1 of [11]. Then, we have

\[
\lim_{n \to \infty} |\psi_n - e^{-i t_n^1 \partial_x^2} \phi^1(0)|^{p+1} = \lim_{n \to \infty} \{ (\psi_n(0) - e^{-i t_n^1 \partial_x^2} \phi^1(0))(\psi_n(0) - e^{-i t_n^1 \partial_x^2} \phi^1(0)) \}^{p+1}
\]

\[
= |\psi(0)|^{p+1} = \lim_{n \to \infty} (|\psi_n(0)|^{p+1} - |e^{-i t_n^1 \partial_x^2} \phi^1(0)|^{p+1}),
\]

i.e.

\[
(3.4) \quad \lim_{n \to \infty} |\psi_n(0)|^{p+1} - |e^{-i t_n^1 \partial_x^2} \phi^1(0)|^{p+1} - |w_n(0)|^{p+1} = 0.
\]

If \( t_n^1 \to t^* \) for some finite \( t^* \), by the time continuity of free Schrödinger group, \( \lim_{n \to \infty} \psi_n(0) = \psi(0) = [e^{-i t^* \partial_x^2} \phi^1](0) \). Thus we may write

\[
\lim_{n \to \infty} \left| \psi_n - e^{-i t_n^1 \partial_x^2} \phi^1(0) \right|^{p+1} = \lim_{n \to \infty} \left( |\psi_n(0)|^2 - |e^{-i t_n^1 \partial_x^2} \phi^1(0)|^2 \right)^{p+1}
\]

\[
= 0 = \lim_{n \to \infty} \left( |\psi_n(0)|^{p+1} - |e^{-i t_n^1 \partial_x^2} \phi^1(0)|^{p+1} \right),
\]

which again gives (3.4).

Repeat the process, keeping the same \( A \) but switching to \( B_2 \) obtaining \( R_2 \) in terms of \( B_2 \). Basically this amounts to replacing \( \psi_n \) by \( \psi_n - e^{-i t_n^1 \partial_x^2} \phi^1 \) and rewriting the above to obtain \( t_n^2 \) and \( \phi^2 \) where

\[
\phi^2 = \text{weak lim} [e^{-i t_n^2 \partial_x^2} (\psi_n - e^{-i t_n^1 \partial_x^2} \phi^1)] \quad \text{in } H^1_x.
\]

As a result,

\[
\lim_{n \to \infty} \|\psi_n - e^{-i t_n^1 \partial_x^2} \phi^1 - e^{-i t_n^2 \partial_x^2} \phi^2\|_{H^2_x}^2 = \lim_{n \to \infty} \|\psi_n - e^{-i t_n^1 \partial_x^2} \phi^1\|_{H^2_x} - \|\phi^2\|_{H^2_x}^2
\]

\[
= \lim_{n \to \infty} \|\psi_n\|_{H^2_x}^2 - \|\phi^1\|_{H^2_x}^2 - \|\phi^2\|_{H^2_x}^2,
\]

and same for

\[
\lim_{n \to \infty} \left| \psi_n - e^{-i t_n^1 \partial_x^2} \phi^1 - e^{-i t_n^2 \partial_x^2} \phi^2(0) \right|^{p+1}
\]

\[
= \lim_{n \to \infty} \left| \psi_n(0)|^{p+1} - |e^{-i t_n^1 \partial_x^2} \phi^1(0)|^{p+1} - |e^{-i t_n^2 \partial_x^2} \phi^2(0)|^{p+1} \right).
\]

If \( t_n^2 - t_n^1 \) converged to something finite (say \( t^* \)), then \( \phi^2 \) would be the weak limit of \( e^{it^* \partial_x^2} [e^{-i t_n^1 \partial_x^2} \psi_n - \phi^1] \), which is zero, contradicting the lower bound. Hence \( |t_n^1 - t_n^2| \to \infty \) and thus

\[
\langle e^{-i t_n^1 \partial_x^2} \phi^1, e^{-i t_n^2 \partial_x^2} \phi^2 \rangle_{H^2_x} \to 0.
\]

Again repeat this process, we have

\[
\|\phi^1\|_{H^2_x}^2 + \|\phi^1\|_{H^2_x}^2 + \cdots + \|\phi^M\|_{H^2_x}^2 + \lim_{n \to +\infty} \|w_n^M\|_{H^2_x}^2 = \lim_{n \to +\infty} \|\psi_n\|_{H^2_x}^2.
\]
Let $B_{M+1} := \lim_{n \to +\infty} \| [e^{i\theta^2 q} u^M_n](0) \|_{L^q_{\mathcal{R}_t}}$ and we wish to show that $B_{M+1} \to 0$. Note that from the above equality and the lower bound for $\| \phi^M \|_{H^{\sigma_c}}$, we obtain
\[
\sum_{M=1}^{\infty} R_{M}^{-\theta} B_{M+2}^2 = 2A \frac{2(q-1)}{q-2}, \quad \theta = \frac{1}{q-2} + \frac{1}{2} - \sigma_c = \frac{1}{2(p-2)} + \frac{1}{2} - \sigma_c > 0,
\]
whose LHS diverges if $B_M$ does not converge to 0. \hfill \square

**Lemma 3.2.** With $w^M_n$ as defined in Proposition 3.1 (in particular, $w_n^0 = \psi_n$), let
\[
B_M = \lim_{n \to \infty} \| [e^{i\theta^2 q} u^M_n](0) \|_{L^q_{\mathcal{R}_t}}.
\]
Then
\[
\lim_{n \to \infty} \| [e^{i(t-t^*_n)\theta^2 q} \phi^M](0) \|_{L^q_{\mathcal{R}_t}} \leq 2B_M.
\]

**Proof.** We will write the argument for $M = 1$ (the general case is analogous). As in the proof of Proposition 3.1 let
\[
A = \lim_{n \to \infty} \| \psi_n \|_{H^1^\sigma}
\]
and
\[
R_1 = (2AB_1^{-1})^{\max(\frac{1}{\sigma_c}, 1-\sigma_c)}
\]
and $\chi_{R_1}(\xi)$ be a cutoff to $R_1^{-1} \leq |\xi| \leq R_1$. As in the beginning of the proof of Proposition 3.1,
\[
\| (\delta - \tilde{\chi}_{R_1}) \ast e^{i(t-t^*_n)\theta^2 q} \phi^1(0) \|_{L^q_{\mathcal{R}_t}} \lesssim \| (\delta - \tilde{\chi}_{R_1}) \ast e^{i\theta^2 q} \phi^1(0) \|_{H^{2\sigma_c+1}}^2
\]
\[
\lesssim \| (\delta - \tilde{\chi}_{R_1}) \ast \phi^1 \|_{H^{\sigma_c}}^2 \lesssim R_1^{-2\sigma_c} \| \phi^1 \|_{L^2}^2 + R_1^{-2(1-\sigma_c)} \| \phi^1 \|_{H^1}^2
\]
\[
\leq A^2 (R_1^{-2\sigma_c} + R_1^{-2(1-\sigma_c)}) \leq \frac{1}{4} B_1^2
\]
This, and the similar estimates at the beginning of the proof of Proposition 3.1 show that it suffices to prove
\[
\lim_{n \to \infty} \| \tilde{\chi}_{R_1} \ast e^{i(t-t^*_n)\theta^2 q} \phi^1(0) \|_{L^q_{\mathcal{R}_t}}^2 \leq \frac{1}{4} B_1^2,
\]
and this can be seen as follows. By the translation invariance of $L^q_{\mathcal{R}_t}$ norm,
\[
\| \tilde{\chi}_{R_1} \ast e^{i(t-t^*_n)\theta^2 q} \phi^1(0) \|_{L^q_{\mathcal{R}_t}} = \| \tilde{\chi}_{R_1} \ast e^{i\theta^2 q} \phi^1(0) \|_{L^q_{\mathcal{R}_t}}
\]
and by Sobolev embedding and Proposition 2.1, we have,
\[
\| \tilde{\chi}_{R_1} \ast e^{i\theta^2 q} \phi^1(0) \|_{L^q_{\mathcal{R}_t}} \lesssim \| \tilde{\chi}_{R_1} \ast e^{i\theta^2 q} \phi^1(0) \|_{H^{2\sigma_c+1}}^2
\]
\[
\lesssim \| \tilde{\chi}_{R_1} \ast \phi^1 \|_{H^{\sigma_c}}^2
\]
\[
\lesssim \left( A^2 R_1^{-2(1-\sigma_c)} \right)^{\frac{1}{2}} \leq B_1/2.
\]
\hfill \square
4. Minimal non scattering solution

In this section we will prove that there exists a minimal non scattering solution. For this purpose we prepare the following lemma which gives additional estimates under the situation (1) of Theorem 1.3. We recall that \( \varphi_0 \) is the ground state to (1.1). It is known that \( \varphi_0(x) = 2^{\sigma - 1} e^{-|x|} \) (see (1.9) of [11]).

**Lemma 4.1.** Let \( p > 3 \) and \( \psi_0 \in H_x^1 \). Assume (1.4) and \( \eta(0) < 1 \). If \( \psi \) is a \( H^1_x \) solution to (1.1), then for all \( t \in \mathbb{R} \),

\[
\frac{(p - 1)}{2(p + 1)} \| \partial_x \psi(t) \|_{L^2}^2 \leq E(\psi(t)) \leq \frac{1}{2} \| \partial_x \psi(t) \|_{L^2}^2.
\]

Furthermore, if we take \( \delta > 0 \) such that \( M(\psi_0) \frac{1 - \sigma}{\sigma} E(\psi_0) \leq (1 - \delta) M(\varphi_0) \frac{1 - \sigma}{\sigma} E(\varphi_0) \), then there exists \( c_\delta > 0 \) such that for all \( t \in \mathbb{R} \),

\[
4 \| \partial_x \psi \|_{L^2}^2 - 2 |\psi(0, t)|^{p + 1} \geq c_\delta \| \partial_x \psi_0 \|_{L^2}^2.
\]

**Proof.** The upper bound of the energy in (1.1) follows by the definition of Energy \( E \) and the focusing nonlinearity. Use the sharp Gagliardo-Nirenberg inequality and \( \eta(t) < 1 \) for the lower bound, i.e.,

\[
E(\psi) \quad \geq \quad \frac{1}{2} \| \partial_x \psi \|_{L^2}^2 \left( 1 - \frac{1}{p + 1} \| \psi \|_{L^2}^{\frac{p + 1}{2}} | \partial_x \psi \|_{L^2}^{\frac{p - 3}{2}} \right)
\]

\[
\geq \quad \frac{1}{2} \| \partial_x \psi \|_{L^2}^2 \left( 1 - \frac{1}{p + 1} \| \varphi_0 \|_{L^2}^{\frac{p + 1}{2}} | \partial_x \varphi_0 \|_{L^2}^{\frac{p - 3}{2}} \right)
\]

\[
= \quad \frac{p - 1}{2(p + 1)} \| \partial_x \psi \|_{L^2}^2,
\]

where we have used the fact \( \| \partial_x \varphi_0 \|_{L^2} = \| \varphi_0 \|_{L^2} = 2^{\frac{1}{p - 1}} \) in the last equality (see [11]).

Next, we show (1.2). We may take \( \delta_1 = \delta_1(\delta) > 0 \) such that

\[
\| \psi_0 \|_{L^2}^{\frac{1 - \sigma}{2 \sigma} - 1} | \partial_x \psi(t) \|_{L^2} \leq (1 - \delta_1) \| \varphi_0 \|_{L^2}^{\frac{1 - \sigma}{2 \sigma} - 1} | \partial_x \varphi_0 \|_{L^2},
\]

for all \( t \in \mathbb{R} \). Let

\[
h(t) := \frac{1}{\| \varphi_0 \|_{L^2}^{\frac{1 - \sigma}{2 \sigma}} \| \partial_x \varphi_0 \|_{L^2}^{\frac{2}{2}}} (4 \| \psi_0 \|_{L^2}^{\frac{2(1 - \sigma)}{\sigma} - 1} | \partial_x \psi(t) \|_{L^2}^2 - 2 \| \psi_0 \|_{L^2}^{\frac{2(1 - \sigma)}{\sigma} - 1} | \psi(0, t) |^{p + 1}).
\]

By Gagliardo-Nirenberg inequality,

\[
h(t) \geq g \left( \frac{\| \psi_0 \|_{L^2}^{\frac{1 - \sigma}{2 \sigma}} | \partial_x \psi(t) \|_{L^2}}{\| \varphi_0 \|_{L^2}^{\frac{1 - \sigma}{2 \sigma}} | \partial_x \varphi_0 \|_{L^2}} \right),
\]

where \( g(y) := 4(y^2 - y^{\frac{p+1}{2}}) \). The inequality (1.3) implies the variable \( y \) of \( g(y) \) is in the interval \( 0 \leq y \leq 1 - \delta_1 \) and then we see that there exists a constant \( c = c_{\delta_1} > 0 \) such that \( g(y) \geq cy^2 \) if \( 0 \leq y \leq 1 - \delta_1 \).
Lemma 4.2. (Existence of wave operator) Let $p > 3$. Suppose $\psi^+ \in H^1_x$ and

\begin{equation}
\frac{1}{2} \| \psi^+ \|^2_{L^2} \| \partial_x \psi^+ \|^2_{L^2} < M(\varphi_0)^{\frac{1}{p-\sigma_c}} E(\varphi_0).
\end{equation}

There exists $\varphi_0 \in H^1_x$ such that $\psi$ solving \((L.1)\) with initial data $\psi_0$ is global in $H^1_x$, with

\begin{align*}
M(\psi) &= \| \psi^+ \|^2_{L^2}, \\
E(\psi) &= \frac{1}{2} \| \partial_x \psi^+ \|^2_{L^2}, \\
\| \partial_x \psi(t) \|_{L^2} \| \varphi_0 \|_{L^2}^{\frac{1}{p-\sigma_c}} < \| \varphi_0 \|_{L^2}^{\frac{1}{p-\sigma_c}} \| \partial_x \varphi_0 \|_{L^2}
\end{align*}

and

\[ \lim_{t \to +\infty} \| \psi(t) - e^{it\partial_x^2} \psi^+ \|_{H^1_x} = 0. \]

Moreover, if $\| [e^{it\partial_x^2} \psi^+]_{L^1_{t>0}} \|_{L^q_{t>0}} \leq \delta_{sd}$, then

\[ \| \psi_0 \|_{H^\sigma_c} \leq 2 \| \psi^+ \|_{H^\sigma_c}, \hspace{1cm} \| \psi(0, \cdot) \|_{L^q_{t>0}} \leq 2 \| [e^{it\partial_x^2} \psi^+]_{(0)} \|_{L^q_{t>0}}. \]

The statement above is for the case $t > 0$, but the case $t < 0$ can be similarly proved.

**Proof.** It suffices to solve the integral equation:

\[ \psi(t) = e^{it\partial_x^2} \psi^+ - i \Lambda(\| \psi(0) \|^p \psi(0))(t) \]

for $t \geq T$ with $T$ large. Since

\[ \| [e^{it\partial_x^2} \psi^+]_{(0)} \|_{L^q_{t>0}} \lesssim \| [e^{it\partial_x^2} \psi^+]_{(0)} \|_{L^q_{t>0}}^{\frac{2\sigma_c+1}{p-\sigma_c}} \leq \| \psi^+ \|_{H^\sigma_c}, \]

there exists a large $T > 0$ such that $\| [e^{it\partial_x^2} \psi^+]_{(0)} \|_{L^q_{t>0}} \leq \delta_{sd}$. Thus we may solve as in the proof of Proposition 2.3

\[ \| \psi(0, \cdot) \|_{L^q_{(T, +\infty)}} \leq \| [e^{it\partial_x^2} \psi^+]_{(0)} \|_{L^q_{(T, +\infty)}} + C \| \Lambda(\| \psi(0) \|^p \psi(0))(\cdot) \|_{L^q_{(T, +\infty)}} \]

\[ \leq \| [e^{it\partial_x^2} \psi^+]_{(0)} \|_{L^q_{(T, +\infty)}} + C \| \psi(0, \cdot) \|_{L^p_{(T, +\infty)}}^p. \]

If $T$ is sufficiently large, we have $\| \psi(0, \cdot) \|_{L^q_{(T, +\infty)}} < 2 \| [e^{it\partial_x^2} \psi^+]_{(0)} \|_{L^q_{(T, +\infty)}}$. Using this, similarly as in the proof of Proposition 2.4, we obtain if $t \geq T$,

\[ \| \psi(t) - e^{it\partial_x^2} \psi^+ \|_{L^2} \leq C \| \Lambda(\| \psi(0) \|^p \psi(0))(\cdot) \|_{L^q_{(T, +\infty)}} \leq \| \psi(0, \cdot) \|_{L^p_{(T, +\infty)}} \leq C \delta_{sd}^p, \]

\[ \| \psi(t) - e^{it\partial_x^2} \psi^+ \|_{H^1} \leq C \| \chi_{[T, +\infty)} \| \psi(0, \cdot) \|_{H^1} \leq C \delta_{sd}^{\sigma_c}, \]

which are small if $T$ is sufficiently large. Thus, $\psi(t) - e^{it\partial_x^2} \psi^+ \to 0$ in $H^1_x$ as $t \to +\infty$.

Note that $\| \partial_x e^{it\partial_x^2} \psi^+ \|_{L^2} = \| \partial_x \psi^+ \|_{L^2}$. On the other hand, since $[e^{it\partial_x^2} \psi^+]_{(0)}$ is uniformly bounded in $L^q_{t>0}$, there exists a sequence $\{t_n\} \to +\infty$ such that $[e^{it_n\partial_x^2} \psi^+]_{(0)} \to 0$ as $n \to +\infty$. Together with all these facts, we have

\[ E(\psi(t)) = \lim_{n \to +\infty} \left\{ \frac{1}{2} \| \partial_x e^{it_n\partial_x^2} \psi^+ \|_{L^2} - \frac{1}{p+1} \| e^{it_n\partial_x^2} \psi^+ (0) \|_{L^2} \right\} = \frac{1}{2} \| \partial_x \psi^+ \|_{L^2}. \]
Similarly, \( M(\psi(t)) = \|\psi^+\|_{L^2_x}^2 \). It now follows from (1.4) that

\[
M(\psi(t))^{1-\sigma_c} E(\psi(t)) < M(\varphi_0)^{1-\sigma_c} E(\varphi_0),
\]

and

\[
\lim_{t \to +\infty} \|\partial_x \psi(t)\|_{L^2_x}^{\frac{2(1-\sigma_c)}{\sigma_c}} \|\psi(t)\|_{L^2_x}^{\frac{2(1-\sigma_c)}{\sigma_c}} = \lim_{t \to +\infty} \|\partial_x e^{it\partial^2_x} \psi^+\|_{L^2_x}^{\frac{2(1-\sigma_c)}{\sigma_c}} \|\psi^+\|_{L^2_x}^{\frac{2(1-\sigma_c)}{\sigma_c}}
\]

\[
= \|\partial_x \psi^+\|_{L^2_x}^{\frac{2}{\sigma_c}} \|\psi^+\|_{L^2_x}^{\frac{2}{\sigma_c}} < 2M(\varphi_0)^{1-\sigma_c} E(\varphi_0) = \frac{p-3}{p+1}\|\partial_x \varphi_0\|_{L^2_x}^{\frac{2}{\sigma_c}} \|\varphi_0\|_{L^2_x}^{\frac{2}{\sigma_c}}.
\]

We can take a large \( T \) such that \( \|\partial_x \psi(T)\|_{L^2} \|\psi(T)\|_{L^2}^{\frac{1-\sigma_c}{\sigma_c}} < \|\partial_x \varphi_0\|_{L^2} \|\varphi_0\|_{L^2}^{\frac{1-\sigma_c}{\sigma_c}} \). Then, applying Theorem 1.3 we evolve \( \psi(t) \) from \( T \) back to the time 0.

We are now in position to enter in the main subject of this section. If the initial data \( \psi_0 \) to (1.1) satisfies \( M(\psi_0)^{1-\sigma_c} E(\psi_0) \leq \frac{p-1}{2(p+1)} \delta_{sd} \) and \( \eta(0) < 1 \), we have

\[
\|\psi_0\|_{H^{\sigma_c}(\mathbb{R})}^{\frac{2}{\sigma_c}} \leq \|\psi_0\|_{L^2_x}^{\frac{2}{\sigma_c}} \|\partial_x \psi_0\|_{L^2_x}^{\frac{2}{\sigma_c}} \leq M(\psi_0)^{1-\sigma_c} E(\psi_0) \leq \delta_{sd},
\]

and the scattering holds by the small data scattering, Proposition 2.3. Now let \( A \) be the infimum of \( M(\psi)^{1-\sigma_c} E(\psi) \), taken over all evolution of \( \psi \) which does not scatter. In what follows NLS\((t)\psi \) denotes the solution to (1.1) with initial data \( \psi \). By the above argument, \( 0 < \frac{p-1}{2(p+1)} \delta_{sd} \leq A \), and moreover due to Proposition 2.3, \( A \) satisfies

1. For any \( \psi \) such that \( M(\psi)^{1-\sigma_c} E(\psi) < A \), it holds \( \|\text{NLS}(t)\psi(0, \cdot)\|_{L^2_{xt}} < \infty \),
2. For any \( A' > A \), there exists a non scattering NLS\((t)\psi \) for which

\[
A \leq M(\psi)^{1-\sigma_c} E(\psi) \leq A'.
\]

If \( A \geq M(\varphi_0)^{1-\sigma_c} E(\varphi_0) \), Theorem 1.4 is true. We therefore proceed with the proof by assuming \( A < M(\varphi_0)^{1-\sigma_c} E(\varphi_0) \).

The first task is to apply the profile decomposition to show that there exists \( \psi \) such that \( M(\psi)^{1-\sigma_c} E(\psi) = A \) and NLS\((t)\psi \) does not scatter. We will call such a solution a minimal non scattering solution. Take a sequence of initial data \( \psi_{0,n} \), with

\[
1 > \eta_n(0) := \|\psi_{0,n}\|_{L^2_x}^{\frac{1-\sigma_c}{\sigma_c}} \|\partial_x \psi_{0,n}\|_{L^2_x}^{\frac{1-\sigma_c}{\sigma_c}} \|\varphi_0\|_{L^2_x}^{\frac{1-\sigma_c}{\sigma_c}} \|\partial_x \varphi_0\|_{L^2_x}^{\frac{1-\sigma_c}{\sigma_c}},
\]

each evolving to non scattering solutions, for which \( M(\psi_{0,n}) = 1 \), \( E(\psi_{0,n}) \geq A \) and \( E(\psi_{0,n}) \to A \). Apply the profile decomposition to \( \psi_{0,n} \) which is uniformly bounded in \( H^1 \) to obtain, extracting a

subsequence,

\[ \psi_{0,n} = \sum_{j=1}^{M} e^{-it_j \partial^2_x} \phi^j \]

\[ E(\psi_{0,n}) = \sum_{j=1}^{M} E(e^{-it_j \partial^2_x} \phi^j) + E(w_n^M) + o_n(1), \]

where \( M \) will be taken large later. Remark that each term in (4.6) is non negative by the same reason for (4.1), using the decompositions (3.1) and (3.2) in \( \eta_n(0) < 1 \).

Taking the limit \( n \to \infty \) in both hand sides,

\[ \lim_{n \to \infty} \sum_{j=1}^{M} E(e^{-it_j \partial^2_x} \phi^j) \leq A \]

for all \( j \). Also, by \( \sigma_c = 0 \) in (3.1), we have

\[ \sum_{j=1}^{M} M(\phi^j) + \lim_{n \to \infty} M(w_n^M) = \lim_{n \to \infty} M(\psi_{0,n}) = 1. \]

Here we consider two cases.

Case 1 There are at least two indexes \( j \) such that \( \phi^j \) is not zero.

Case 2 Only one profile is non zero, i.e. without loss of generality \( \phi^1 \neq 0 \), and \( \phi^j = 0 \) for all \( j \geq 2 \).

We begin with Case 1. By (4.8), we necessarily have \( 0 \leq M(\phi^j) < 1 \) for each \( j \) which, by (1.7), implies that for \( n \) sufficiently large

\[ M(e^{-it_n \partial^2_x} \phi^j) \frac{1 - \sigma_c}{\sigma_c} E(e^{-it_n \partial^2_x} \phi^j) \leq A_j, \]

with each \( A_j < A \). For a given \( j \), there are two possibilities. Case a) \( |t_n^j| \to \infty \) as \( n \to \infty \) and Case b) there is a finite limit \( t_* \) such that \( t_n^j \to t_* \) as \( n \to \infty \). Both cases allow us to ensure the existence of a new profile \( \tilde{\phi}^j \in H^1 \) associated to \( \phi^j \) such that

\[ \| \text{NLS}(-t_n^j) \tilde{\phi}^j - e^{-it_n^j \partial^2_x} \phi^j \|_{H^1} \to 0, \quad n \to \infty; \]

indeed, if Case a) occurs, by the uniform \( L^q \) integrability in time of \( |e^{-it \partial^2_x} \phi^j|(0) \) (cf. the same argument in Proposition 3.1), passing to a subsequence of \( t_n^j \),

\[ \| e^{-it_n^j \partial^2_x} \phi^j \|_{L^1} \to 0, \quad n \to \infty \]

and thus

\[ \frac{1}{2} \| \phi^j \|_{L^2}^{2(1-\sigma_c)} \| \partial_x \phi^j \|_{L^2}^2 < A. \]

Since \( A < M(\phi^1)^{1-\sigma_c} E(\phi^1) \), \( \phi^j \) satisfies the assumption of Lemma 4.2. Namely, there exists \( \tilde{\phi}^j \in H^1 \) such that

\[ \| \text{NLS}(-t_n^j) \tilde{\phi}^j - e^{-it_n^j \partial^2_x} \phi^j \|_{H^1} \to 0, \quad n \to \infty. \]
with
\[ M(\tilde{\phi}^j) = \|\phi^j\|_{L^2}^2, \quad E(\tilde{\phi}^j) = \frac{1}{2}\|\partial_x \phi^j\|_{L^2}^2, \]
\[ \|\partial_x \text{NLS}(t)\tilde{\phi}^j\|_{L^2} \leq \|\phi^j\|_{L^2}^{1-\sigma_c} \|\partial_x \phi^j\|_{L^2} \leq A. \]

and thus
\[ M(\tilde{\phi}^j) \leq A. \]

Therefore by the definition of threshold \( A \), we have
\[ (4.10) \quad \|\text{NLS}(t)\tilde{\phi}^j(0)\|_{L^2_{\text{tr}}} < +\infty. \]

If the Case b), by the time continuity in \( H^1_x \) norm of the linear flow, we know
\[ e^{-it\partial_x^2} \phi^j \to e^{-it\partial_x^2} \phi^j \text{ in } H^1_x. \]
Thus it suffices to put \( \tilde{\phi}^j := \text{NLS}(t)[e^{-it\partial_x^2} \phi^j] \). Then this \( \tilde{\phi}^j \) again satisfies \( (4.10) \).

To see this, note first that by the \( H^1 \) continuity of the flow, sending \( n \to \infty \) in \( (4.9) \) gives
\[ M(e^{-it\partial_x^2} \phi^j)^{1-\sigma_c} E(e^{-it\partial_x^2} \phi^j) \leq A < A. \]

By \( (3.1) \) applied for \( \sigma_c = 0 \) and \( \sigma_c = 1 \), and the assumption that \( \eta_n(0) < 1 \) for every \( n \), we obtain that
\[ \frac{\|\phi^j\|_{L^2_x}^{1-\sigma_c} \|\partial_x \phi^j\|_{L^2_x}^{1-\sigma_c} \|\phi^j\|_{L^2_x} \|\partial_x \phi^j\|_{L^2_x}}{\|\phi^j\|_{L^2_x}^{1-\sigma_c} \|\partial_x \phi^j\|_{L^2_x}} < 1. \]

By the defining property of the threshold \( A \), we have that the NLS flow with initial data \( e^{-it\partial_x^2} \phi^j \) scatters, i.e.
\[ \|\text{NLS}(t)\tilde{\phi}(0)\|_{L^q_{\text{tr}}} = \|\text{NLS}(t + t^*)e^{-it\partial_x^2} \phi^j(0)\|_{L^q_{\text{tr}}} < \infty. \]

Now replace \( e^{-it\partial_x^2} \phi^j \) by \( \text{NLS}(-t^j_n)\tilde{\phi}^j \) in \( (4.5) \), and we have
\[ \psi_{0,n} = \sum_{j=1}^M \text{NLS}(-t^j_n)\tilde{\phi}^j + \tilde{w}_n^M, \]
with
\[ \tilde{w}_n^M = w_n^M + \sum_{j=1}^M (e^{-it\partial_x^2} \phi^j - \text{NLS}(-t^j_n)\tilde{\phi}^j). \]
Note that by Sobolev embedding and Proposition \textbf{2.1} (1),

$$\left\| e^{it\partial^2_x} \tilde{w}_n^M(0) \right\|_{L^q_{xt}} 
\leq \left\| e^{it\partial^2_x} w_n^M(0) \right\|_{L^q_{xt}} + \sum_{j=1}^M \left\| e^{it\partial^2_x} (-\text{NLS}(-t_{i_n}^j)\tilde{\phi}^j + e^{-it_n^j\partial^2_x}\phi^j)(0) \right\|_{L^q_{xt}}$$

$$\leq \left\| e^{it\partial^2_x} w_n^M(0) \right\|_{L^q_{xt}} + \sum_{j=1}^M \left\| \text{NLS}(-t_{i_n}^j)\tilde{\phi}^j - e^{-it_n^j\partial^2_x}\phi^j \right\|_{H_x^{\sigma_\epsilon}},$$

$$\leq \left\| e^{it\partial^2_x} w_n^M(0) \right\|_{L^q_{xt}} + \sum_{j=1}^M \left\| \text{NLS}(-t_{i_n}^j)\tilde{\phi}^j - e^{-it_n^j\partial^2_x}\phi^j \right\|_{H_x^1}.$$ 

Thus we obtain,

$$\lim_{M \to +\infty} \left[ \lim_{n \to +\infty} \left\| e^{it\partial^2_x} \tilde{w}_n^M(0) \right\|_{L^q_{xt}} \right] = 0.$$

From this way of writing we might approximately see

$$\text{NLS}(t)\psi_{n,0} \approx \sum_{j=1}^M \text{NLS}(t - t_{i_n}^j)\tilde{\phi}^j.$$ 

However, from (4.10), the RHS is finite in $L^q_{xt}$ norm, while the LHS cannot scatter by assumption, and so a contradiction could be deduced. We shall justify this argument by Proposition \textbf{2.5}.

Let $v^j(t) := \text{NLS}(t)\tilde{\phi}^j$, $\psi_n := \text{NLS}(t)\psi_{0,n}$, and $\tilde{\psi}_n = \sum_{j=1}^M v^j(t - t_{i_n}^j)$. Then, $\tilde{\psi}_n$ satisfies

$$i\partial_t \tilde{\psi}_n + \partial^2_x \tilde{\psi}_n + \delta(|\tilde{\psi}_n|^{p-1}\tilde{\psi}_n + e_n) = 0.$$ 

Here,

$$e_n := -|\tilde{\psi}_n|^{p-1}\tilde{\psi}_n + \sum_{j=1}^M |v^j(t - t_{i_n}^j)|^{p-1}v^j(t - t_{i_n}^j).$$ 

We are going to show that

1. there exists a large constant $A$ independent of $M$ satisfying the following property: for any $M$ there is $n_0 = n_0(M)$ such that if $n > n_0$, $\|\tilde{\psi}_n(0, \cdot)\|_{L^q_{xt}} \leq A$.

2. For each $M$ and $\epsilon > 0$ there exists $n_1 = n_1(M, \epsilon)$ such that for $n > n_1$, $\|e_n\|_{L^q_{xt}} \leq \epsilon$.

Remark that there exists $M_1 = M_1(\epsilon)$ such that for each $M > M_1$, there exists $n_2 = n_2(M)$ such that if $n > n_2$, $\|e^{it\partial^2_x}(\tilde{\psi}_n^M(0) - \psi_n^M(0))\|_{L^q_{xt}} \leq \epsilon$. Thus, if the above 1 and 2 hold, it follows from Proposition \textbf{2.5} that for $n$ and $M$ sufficiently large,
\[ \|\psi_n\|_{L^q_{Rt}} < \infty, \] which gives a contradiction. Therefore it is enough to prove the above claims 1 and 2. First we prove the claim 1. Take \( M_0 \) large enough so that
\[ \|e^{i\partial_x^2} u_n^{M_0}(0)\|_{L^q_{Rt}} \leq \delta_{ad} / 2. \]

Then, by Lemma 3.2, for each \( j > M_0 \), we have \( \|e^{i(t-t^j_n)\partial_x^2} \phi_j\|_{L^q_{Rt}} \leq \delta_{ad} \). Thus by Lemma 4.2, we obtain, for each \( j > M_0 \), for each \( n \),
\[ \|v^j(0, \cdot - t^j_n)\|_{L^q_{Rt}} \leq 2\|e^{i(t-t^j_n)\partial_x^2} \phi_j\|_{L^q_{Rt}}. \]

By Minkowski inequality (since \( p > 3 \)),
\[ \|\psi_n(0, \cdot)\|_{L^q_{Rt}}^q \leq C_q \left( \sum_{j=1}^{M_0} \|v^j(0, \cdot - t^j_n)\|_{L^q_{Rt}}^q + \sum_{j=M_0+1}^M \|v^j(0, \cdot - t^j_n)\|_{L^q_{Rt}}^q \right) \]
\[ \leq C_q \left( \sum_{j=1}^{M_0} \|v^j(0, \cdot - t^j_n)\|_{L^q_{Rt}}^q + \sum_{j=M_0+1}^M \|v^j(0, \cdot - t^j_n)\|_{L^q_{Rt}}^q \right) \]
\[ + \sum_{j=M_0+1}^M \|v^j(0, \cdot - t^j_n)\|_{L^q_{Rt}}^q \]
\[ \leq C_q \left( \sum_{j=1}^{M_0} \|v^j(0, \cdot - t^j_n)\|_{L^q_{Rt}}^q + \sum_{j=M_0+1}^M \|e^{i(t-t^j_n)\partial_x^2} \phi_j\|_{L^q_{Rt}}^q \right) \]
\[ + \sum_{j=M_0+1}^M \|v^j(0, \cdot - t^j_n)\|_{L^q_{Rt}}^q \]
\[ + \sum_{j=M_0+1}^M \|v^j(0, \cdot - t^j_n)\|_{L^q_{Rt}}^q \]

where we have used (4.11). The last terms \( \sum_{j\neq m} \|v^j v^m\|_{L^q_{Rt}}^{q/2} \) can be made small if \( n \) is large (see the argument below for the claim 2). On the other hand, using (1.4), the same argument for (3.2) allows us to obtain
\[ \|e^{i\partial_x^2} \psi_{0,n}(0)\|^q = \sum_{j=1}^M \|e^{i(t-t^j_n)\partial_x^2} \phi_j\|^q + \|e^{i\partial_x^2} u_n^{M}(0)\|^q + o_n(1), \]
thus, integrating in time,
\[
\|e^{it\partial_2^2} \psi_{0,n}(0)\|_{L^q_{t x}} = \sum_{j=1}^{M_0} \|e^{i(t-t_{j_0})\partial_x^2} \phi_j(0)\|_{L^q_{t x}}
\]
\[+ \sum_{j=M_0+1}^{M} \|e^{i(t-t_{j_0})\partial_x^2} \phi_j(0)\|_{L^q_{t x}} + \|e^{it\partial_2^2} w_n^M(0)\|_{L^q_{t x}} + o_n(1)
\]
which shows that \(\sum_{j=M_0+1}^{M} \|e^{i(t-t_{j_0})\partial_x^2} \phi_j(0)\|_{L^q_{t x}}\) is bounded independently of \(M\) if \(n > n_0\) since \(\|e^{it\partial_x^2} \psi_{0,n}(0)\|_{L^q_{t x}} \leq \|\psi_{0,n}\|_{H^\infty_x}\). Recall that \(\|v^j(0, \cdot - t_{j_0})\|_{L^q_{t x}} = \|\text{NLS}(t) \tilde{\phi}(0)\|_{L^q_{t x}} < \infty\). Therefore \(\|\tilde{\psi}_n(0, \cdot)\|_{L^q_{t x}}\) is bounded independently of \(M\) provided \(n > n_0\).

We next prove the claim 2. We see that \(e_n\) is estimated using Hölder inequality with \(\frac{1}{q} = \frac{2}{q_1} + \frac{2}{q_2}\) as follows.
\[
\|e_n\|_{L^q_{t x}} \leq C_p \sum_{j=1}^{M} \left( \|v^j\|_{L^q_{t x}}^{p-2} + \sum_{j=1}^{M} \|v^j\|_{L^q_{t x}}^{p-2} \right) \left( \|v^1 + \cdots + v^{j-1} + v^{j+1} + \cdots + v^M\|_{L^q_{t x}} \right)
\]
where we abbreviated \(v^j(0, t - t_{j_0}^2)\) as \(v^j\). Here, note that by (4.10), for any \(\varepsilon > 0\), there exists a large \(R > 0\) such that
\[
\|\text{NLS}(t - t_n^k) \tilde{\phi}(0)\|_{L^q((t:|t-t_n^k| > R))} < \varepsilon.
\]
Thus, taking large \(n\) such that \(|t_{j_0}^j - t_{j_0}^k| > 2R\) with \(j \neq k\) for such a \(R > 0\), we can estimate \(\|v^j v^k\|_{L^q_{t x}}\) as follows:
\[
\|v^j v^k\|_{L^q_{t x}} \leq \|\text{NLS}(t - t_{j_0}^j) \tilde{\phi}(0)\|_{L^q_{t x}}\|\text{NLS}(t - t_{j_0}^k) \tilde{\phi}(0)\|_{L^q_{t x}}
\]
\[\leq \|\text{NLS}(t - t_{j_0}^j) \tilde{\phi}(0)\|_{L^q((t:|t-t_{j_0}^j| > R))}\|\text{NLS}(t - t_{j_0}^k) \tilde{\phi}(0)\|_{L^q_{t x}}
\]
\[+ \|\text{NLS}(t - t_{j_0}^j) \tilde{\phi}(0)\|_{L^q_{t x}}\|\text{NLS}(t - t_{j_0}^k) \tilde{\phi}(0)\|_{L^q((t:|t-t_{j_0}^k| > R))}
\]
\[\leq C \varepsilon.
\]
This shows that there exists \(n_1\) such that the \(L^q\) norm of \(e_n\) is small if \(n > n_1(M, \varepsilon)\).

Now we consider Case 2. In this case, we have \(M(\phi^1) \leq 1\) and \(\lim_{n \to \infty} E(e^{-it_n^1 \partial_x^2} \phi^1) \leq A\). As in the Case 1, by the existence of wave operator, there is \(\tilde{\phi}^1 \in H^1_x\) such that
\[
\|\text{NLS}(-t_{n}^1) \tilde{\phi}^1 - e^{-it_n^1 \partial_x^2} \phi^1\|_{H^1_x} \to 0, \quad n \to +\infty.
\]
Put
\[
\tilde{w}_n^M := w_n^M - \text{NLS}(-t_{n}^1) \tilde{\phi}^1 + e^{-it_n^1 \partial_x^2} \phi^1
\]
Then we can write
\[
\psi_{0,n} = e^{-it_n^1 \partial_x^2} \phi^1 + w_n^M = \text{NLS}(-t_{n}^1) \phi^1 + \tilde{w}_n^M,
\]
with

\[ \lim_{M \to \infty} \lim_{n \to \infty} \|e^{it\partial_x} \overline{w}_n^M(0)\|_{L^2_{R_t}} = 0. \]

Let \( \psi_c \) be the solution to (1.1) with initial data \( \psi_c(0) = \tilde{\phi}_1 \). Now we claim that \( \|\psi_c(0, \cdot)\|_{L^q_{R_t}} = +\infty \) (and thus \( M(\psi_c) = \frac{\sqrt{-1}}{2\pi} E(\psi_c) = A \)). We proceed as in the Case 1. Suppose \( A := \|\psi_c(0, \cdot)\|_{L^q_{R_t}} < \infty \). By definition, \( \|\text{NLS}(t)\tilde{\phi}_1(0)\|_{L^q_{R_t}} = \|\psi_c(0, \cdot)\|_{L^q_{R_t}} = A \). For any shift \( t' \), we can say \( \|\text{NLS}(t-t')\tilde{\phi}_1(0)\|_{L^q_{R_t}} = \|\text{NLS}(t)\tilde{\phi}_1(0)\|_{L^q_{R_t}} \), thus we take in particular \( t' = t_1 \) and operate NLS(\( t \)) to \( \psi_{0,n} = \text{NLS}(-t_1)\tilde{\phi}_1 + \tilde{w}_n^M \). We apply the perturbation argument by Proposition 2.5 to

\[ \psi_n = \tilde{\psi}_n + \text{NLS}(t)\tilde{w}_n^M, \]

with \( \tilde{\psi}_n = \text{NLS}(t-t_1)\tilde{\phi}_1 \) and \( \|\tilde{\psi}_n(0, \cdot)\|_{L^q_{R_t}} = A < +\infty \). For \( n \) and \( M \) sufficiently large, we have

\[ \|e^{it\partial_x}(\psi_n(0) - \tilde{\psi}_n(0))\|_{L^q_{R_t}} = \|e^{it\partial_x} \overline{w}_n^M(0)\|_{L^q_{R_t}} \leq \epsilon_0, \]

and also the \( L^q \) norm of the corresponding error term is estimated by \( \epsilon_0 \), where \( \epsilon_0 = \epsilon_0(A) \) is obtained in Proposition 2.5. Then, by Proposition 2.5, we have \( \|\psi_n(0, \cdot)\|_{L^q_{R_t}} < \infty \), and this is a contradiction to non scattering assumption on \( \psi_n \).

On the other hand, the proof of Lemma 5.6 in [10] allows us to have also,

**Lemma 4.3.** Suppose \( \{\psi(t, x), t \geq 0\} \) is precompact in \( H^1_x \). Then for any \( \epsilon > 0 \), there exists \( R_\epsilon > 0 \) such that

\[ \sup_{t \geq 0} \int_{|x| \geq R_\epsilon} (|\psi(x, t)|^2 + |\partial_x \psi(t, x)|^2) dx \leq \epsilon. \]

Using this Lemma and the local viriel identity (1.2), we conclude the following proposition.

**Proposition 4.4.** Let \( p > 3 \). Assume \( \psi_0 \in H^1 \) satisfies (1.4) and \( \eta(0) < 1 \). Let \( \psi(t, x) \) be the global solution to (1.1) with the initial data \( \psi_0 \) satisfying the precompactness: for any \( \epsilon > 0 \), there exists \( R_\epsilon > 0 \) such that

\[ \int_{|x| \geq R_\epsilon} (|\psi(x, t)|^2 + |\partial_x \psi(x, t)|^2) dx \leq \epsilon, \quad \text{for all} \quad t \geq 0. \]

Then \( \psi_0 \equiv 0 \).

**Proof.** Take \( a(x) \) in the localized viriel (1.2), as, for \( R > 0 \) (which will be determined later), and for all \( x \in \mathbb{R} \),

\[ a(x) = R^2 \chi \left( \frac{|x|}{R} \right), \]
where \( \chi \in C_0^\infty(\mathbb{R}^+) \), \( \chi(r) = r^2 \) for \( r \leq 1 \), and \( \chi(r) = 0 \) for \( r \geq 2 \). Put \( z_R(t) := \int_\mathbb{R} a(x)|\psi|^2 dx \), then we have
\[
z_R'(t) = -2R \text{Im} \int_\mathbb{R} \frac{x}{R} \partial_x \psi \bar{\psi} dx,
\]
and
\[
z_R''(t) = 8 \int_{|x| \leq R} |\partial_x \psi|^2 dx + 4 \int_{R < |x| < 2R} \chi'' \left( \frac{|x|}{R} \right) |\partial_x \psi|^2 dx - \frac{1}{R^2} \int_{R < |x| < 2R} \chi^{(4)} \left( \frac{|x|}{R} \right) |\psi|^2 dx - 4|\psi(0)|^{p+1}
\]
\[\geq 2\left\{ 4 \int_{|x| \leq R} |\partial_x \psi|^2 dx - 2|\psi(0)|^{p+1} \right\} - C_0 \int_{R < |x| < 2R} (|\partial_x \psi|^2 + \frac{1}{R^2} |\psi|^2) dx
\]
(4.13) \[\geq 2\left\{ 4 \int_{|x| \leq R} |\partial_x \psi|^2 dx - 2|\psi(0)|^{p+1} \right\} - C_0 \int_{R < |x| < 2R} (|\partial_x \psi|^2 + \frac{1}{R^2} |\psi|^2) dx
\]
with a constant \( C_0 = C_0(\|\chi''\|_{L^\infty}, \|\chi^{(4)}\|_{L^\infty}) \) uniform in \( R \).

Take \( 0 < \delta < 1 \) such that
\[
M(\psi_0)^{\frac{1-\varepsilon}{\sigma_c}} E(\psi_0) \leq (1 - \delta) M(\varphi_0)^{\frac{1-\varepsilon}{\sigma_c}} E(\varphi_0),
\]
then by (1.12), there exists \( c_\delta > 0 \) such that for any \( t \in \mathbb{R} \)
(4.14) \[4 \int_{|x| \leq R} |\partial_x \psi|^2 dx - 2|\psi(0)|^{p+1} \geq c_\delta \|\partial_x \psi_0\|^2_{L^2} - 4 \int_{|x| > R} |\partial_x \psi|^2 dx.
\]

Now, we choose \( \varepsilon = \frac{c_\delta}{8 + C_0} \|\partial_x \psi_0\|^2_{L^2} \) in (1.12), then for sufficiently large \( R_1 > \max\{1, R_\varepsilon\} \),
\[
\int_{|x| > R_1} \left( |\partial_x \psi|^2 + \frac{1}{R_1^2} |\psi|^2 \right) dx \leq \int_{|x| > R_1} \left( |\partial_x \psi|^2 + |\psi|^2 \right) dx \leq \varepsilon = \frac{c_\delta}{8 + C_0} \|\partial_x \psi_0\|^2_{L^2}.
\]
Thus, by the choice of \( R = R_1 \), we have (1.11) \[c_\delta \|\partial_x \psi_0\|^2_{L^2} \]
and so
\[z''_{R_1}(t) \geq c_\delta \|\partial_x \psi_0\|^2_{L^2}.
\]
Integration in time then implies
\[z'_{R_1}(t) - z'_{R_1}(0) \geq c_\delta t \|\partial_x \psi_0\|^2_{L^2}.
\]
On the other hand,
\[|z'_{R_1}(t) - z'_{R_1}(0)| \leq CR_1 \]
where \( C \) depends on \( p, \|\psi_0\|_{L^2} \), and \( \|\partial_x \psi_0\|_{L^2} \). This is absurd except the case \( \psi_0 \equiv 0 \).
\[\square\]

Finally we complete our arguments with

**Proposition 4.5.**

\[K = \{ \psi_c(t), t \geq 0 \} \subset H_x^1\]
with \( \psi_c \) obtained above as the minimal non scattering solution, is precompact in \( H_x^1 \).
The proof for this proposition is similar to the proof for the existence of $\psi_c$, and we omit it. We apply Proposition 4.4 to $\psi_c$, and we have $\psi_c(0) \equiv 0$, which contradicts the fact that $\|\psi_c(0, \cdot)\|_{L^q_{t,x}} = +\infty$. This concludes the statement of Theorem 1.4. □
