juandavid.guerrero@uptc.edu.co

All reported Op-codes are fully compatible with the SASS assembly language in the SM\_1.0 for GPGPUs using the G80 microarchitecture. The opcodes were specifically determined to support the verification, testing and operation of the **FlexGripPlus GPGPU model**.

The manual was developed by the Electronic CAD & Reliability Group (CAD) in the Department of Control and Computer Engineering (DAUIN). Politecnico di Torino  
Italy, 2020

The Floating Point Unit (FPU) extension and op-codes were developed in collaboration between Politecnico di Torino and the Grenoble Institute of Technology.

The Special Functions Unit (SFU) extension and op-codes were developed in cooperation between Politecnico di Torino and Universidad Pedagógica y Tecnológica de Colombia (UPTC).

All Activities performed in the development of the **FlexGripPlus GPGPU** model were supported with fundings by the European Commission through the Horizon 2020 **RESCUE-ETN** project under grant 722325. For more information: <http://rescue-etn.eu/>

The **FlexGripPlus GPGPU** model can be downloaded from:

## Glosary:

In the description of the opcodes, the following words are employed to represent the resources in the GPGPU:

- **GPRS:** General Purpose Registers in the Register File.
- **Imm:** Immediate value stored in the instruction code.
- **Rx, Ry, Rz:** Registers
- **Ax:** Address registers
- **SRx:** special system-controlled registers
- **U:** Unsigned value
- **S:** Signed value
- **Cx:** Conditional or predicate registers
- **global14 r[0xXX]:** global or main memory in the GPGPU
- **g[0xXX]:** Shared memory
- **c[0xXX][0xYY]:** Constant memory
- **local[0xXX]:** Local memory

## TABLES OF SASS INSTRUCTIONS SUPPORTED IN FLEXGRIPPLUS

**Table 1 Control-flow instructions supported in FlexGripPlus.**

Mnemonic	Description	Formats
BRA	Branch	BRA CX.COND Imm BRA Imm
BAR	barrier synchronization	BAR.AR.V.WAIT b0, 0xFFFF
RET	Return from kernel	RET RET CX.COND
SSY	Set synchronization point	SSY Imm
NOP	No operation	NOP NOP.S
TRAP	Trap interruption	TRAP
CAL	Call to subroutine	CAL.NOINC CAL

**Table 2 Arithmetic and logic instructions in FlexGripPlus.**

Mnemonic	Description	Formats
I2I	Integer to integer conversion	I2I.U32.U16/S16 RZ, RX(L H) / g[].U16 I2I.U32.S32 RZ,  RX  / -RX I2I.U32.U16.BEXT RZ, RX(L H) / g[].U8 I2I.S32.S16.BEXT RZ, RX(L H) / g[].S8
IMUL/	Integer multiplication	IMUL.U16.U16 RZ, RX(L H) / g[].U16, RY(L H) IMUL.S16.S16 RZ, RX(L H) / g[].S16, RY(L H)
IMUL32/		IMUL32.U16.U16 RZ, RX(L H)/g[].U16, RY(L H)
IMUL32I		IMUL32I.U16.U16 RZ, RX(L H), Imm IMUL32I.S16.S16 RZ, RX(L H), Imm
SHL	Shift left	SHL RZ, RX, RY / Imm SHL RZ, g [], Imm SHL.U16 RZ(L H), RX(L H), Imm
SHR	Shift right	SHR.S32 RZ, RX, RY / Imm SHR.S32 RZ, g [], Imm SHR.U16 / S16 RZ(L H), RX(L H), Imm SHR RZ, g[], Imm SHR RZ, RX, RY / Imm
IADD/	Integer add	IADD RZ, RX / -RX, RY IADD RZ, g[], RX / -RX IADD RZ, RX, c[0x1] []
IADD32/		IADD32 RZ, RX, RY / -RY IADD32 RZ, g [0x..], RX / -RX IADD32.U16 RZ(L H), RX(L H), RY(L H) / -RY(L H)
IADD32I		IADD32I RZ, RX / -RX, Imm IADD32I RZ, g[], Imm
IMAD/	Integer multiply and Add	IMAD.U16/ S16 RZ, RX(L H), RY(L H), RW IMAD.U16/ S16 RZ, RX(L H), c[0x1] [], RY IMAD. RZ, RX(L H), c[0x1] [], RY
IMAD32/		IMAD32.U16 RZ, RXL H, RYL H, RZ
IMAD32I		IMAD32I.U16/ S16 RZ, RX(L H), Imm, RZ
LOP	Bitwise logical Operation	LOP.AND/OR/XOR/PASS_B RZ, RX/ g[], RY LOP.AND/OR/XOR/PASS_B RZ, RX, c[0x1] [] LOP.U16.AND/OR/XOR/PASS_B RZ(L H), RX(L H), RY(L H)
ISET	Integer comparison	ISET RZ, RX, RY / c[0x1] [], COMP_TYPE ISET RZ, g[], RX, COMP_TYPE ISET.S32 RZ, RX, RY / c[0x1] [], COMP_TYPE ISET.S32 RZ, g[], RX, COMP_TYPE

**Table 3 Data handling and memory instructions in FlexGripPlus.**

Mnemonic	Description	Formats
MVC	Load from constant memory	MVC RX, c [0x1] []
GLD	Load from global memory	GLD.U32 U16 S16 U8 S8 RZ, global14[]
GST	Store to global Memory	GST.U32 U16 S16 U8 S8 global14[], RX
MOV/	Move register to register/load from shared memory	MOV RZ, RX / g[] MOV.U16 RZ(L H), RX(L H) / g[].(U16 U8)
MOV32		MOV32 RZ, RX / g[] MOV32.U16 RZ(L H), RX(L H)
MVI	Move immediate to destination	MVI RX, Imm
R2G	Store to shared Memory	R2G.U32.U32 g [], RX R2G.U16.U16 g [], RXL H R2G.U16.U8 g [], RX
R2A	Move data register to address register	R2A AX, RX
A2R	Move address register to data register	A2R RX, AX
ADA	Movement from address register to address register	ADA Ax, Ax, Offset

**Table 4 Floating Point Unit (FPU) instructions supported in FlexGripPlus.**

Mnemonic	Description	Formats
FADD32 / FADD / FADD32I	Floating point addition	FADD32 Rx, Ry / g[Ax + Imm], Rz FADD.COND Rx (Cx), Ry, -Rz / c[0xX][Imm] FADD32I Rx, Ry, Imm
FMUL / FMUL32 / FMUL32I	Floating point multiplication	FMUL Rx(Cx.COND), Ry / g [Ax + Imm], Rz / c[0xX][Imm] FMUL32 Rx, Ry / g [Ax+Imm], Rz FMUL32I Rx, Ry, Imm
FMAD / FMAD32 / FMAD32I	Floating point multiply and addition	FMAD Rx, Ry / - g [Ax+Imm], Rz / c[0xX][Imm], Rw FMAD32I Rx, -Ry, Imm, Rz
F2F	Floating point conversion	F2F.F32.F32 Rx (CX.COND), -Ry /  Ry
F2I	Conversion from Floating point to Integer	F2I.S32.F32.COND Rx, Ry
I2F	Conversion from Integer to Floating point	I2F.F32.S32/U32 Rx (CX.COND), Ry
FSET	Floating point set	FSET.CO o[0x7f] (Cx.COND), Rx /  Rx , Ry / c[0xX][Imm], COND
RCP / RCP32	Reciprocal value	RCP Ry (Cx.COND), Rx RCP32 Ry, Rx

**Table 5 Special function unit (SFU) instructions supported in FlexGripPlus.**

Mnemonic	Description	Formats
SIN	Single precision SIN (32 bits)	SIN Rx, Rx
COS	Single precision COS (32 bits)	COS Rx, Rx
RRO	Range Reduction Operator (phase)	RRO Ry, Rx, (SIN/EX2)
EX2	Find the base-2 exponential of a value.	EX2 Ry, Rx
RSQ	Reciprocal of the square root in single-precision (32 bits)	RSQ Ry, Rx
LG2	Calculates the Log, base 2, of a value	LG2 Ry, Rx

# INSTRUCTIONS

## Control-flow Instructions

**BRA**

**BAR**

**RET**

**SSY**

**NOP**

**TRAP**

**CAL**

## BRA instruction:

**Checked OK**

This instruction generates a change in the warp PC in the SM. (Branch operation in the GPU)

**PC ← offset address****Mnemonics:**Direct BRA (offset address) **BRA 0x1E0**Indirect BRA (predicate\_register.condition) offset\_address **BRA C0.NE, 0x1e0****Example (SASS from NVCC):**

BRA 0xf0 (1001e003 00000780)

BRA C0.NE, 0xe8 (00000280 1001d003)

**(SASS\_assembly\_lib):**

Format: BRA(int offset, int condition, int pred\_reg\_cond, int marker)

**Offset:** bits (51-46) – (26-9)**Condition:** (43-39)**Pred\_reg\_cond:** (45-44)**Marker:** (1-0)**Note:**The original version of this instruction (in FlexGrip) was implemented with an address limit of 18 bits. **(High part of the memory address is not implemented)** GPGPU-FLEXGRIP instruction memory is limited to 18 bits of address pointer. This condition was repaired in the extended version of the model.

Bit(s)	Mnemonics	Commentary																																																																																																					
0	instr_is_long	0 = 32 bit long.	1 = 64 bit long. <b>(by default)</b>																																																																																																				
1	instr_is_flow	0 = Normal ins.	1 = System ins. (flow control) <b>(by default)</b>																																																																																																				
(2 – 8) 7	Not used	000 0000 <b>(by default)</b>																																																																																																					
(9 – 26) 18	Branch Address Low Part 18 bits	The Branch Address (24bits) is divided as HB(2)-MB(8bits)-LB(8 bits) 24 down to 9

**BAR instruction:****Checked**

This instruction generates a barrier condition to synchronize all thread in a warp

**Mnemonics:**

BAR.(type)

**Example (SASS from NVCC):**

BAR.ARV.WAIT b0, 0xff (00000000 861FFE03)

**(SASS\_assembly\_lib):**

Pending...

Bit(s)	Mnemonics	Commentary	
0	instr_is_long	0 = 32 bit long.	1 = 64 bit long. <b>(by default)</b>
1	instr_is_flow	0 = Normal ins.	1 = System ins. (flow control) <b>(by default)</b>
(2 – 27) 26	BAR	0x61FFE0	
(28 – 31) 4	Instruction Op. Code	BAR = 0x8h	
(32 - 33) 2	instr_marker	<b>00</b> normal register access(load or store) (not extra instruction) <b>(by default)</b> <b>01</b> normal register access(load or store) (with <b>Join</b> ) (extra instruction) <b>10</b> normal register access(load or store) (with <b>Exit</b> ) <b>11</b> immediate	
(34 – 63) 30	Not used	00 0000 0000 0000 0000 0000 0000 0000	

**RET instruction:**

Checked YES

This instruction returns from a kernel execution or a thread path (*taken-not taken*) in case of divergence.

**RET** (Return, Employed to finish the operation of the kernel in Flexgrip)

**Mnemonics:**

RET

RET Cx (COND) (predicate condition)

**Example (SASS from NVCC):**

RET (00000780 30000003)

RET CO.NE (00000280 30000003)

RET CO.EQ (00000100 30000003)

RET CO.NE (00000280 30000003)

**(SASS\_assembly\_lib):**Format: RET(int **condition**, int **pred\_reg\_cond**, int **marker**)**Condition:** (43-39)**Pred\_reg\_cond:** (45-44)**Marker:** (1-0)**Note:**

The original version of this instruction (in FlexGrip) was able to stop the kernel execution. The additional feature of returning from a thread path was added in the improved version FlexGrip\*.

0	instr_is_long	0 = 32 bit long.	1 = 64 bit long. <b>(By default)</b>																																																																																																				
1	instr_is_flow	0 = Normal ins	1 = System ins. (flow control) <b>(By default)</b>

**SSY instruction:****Checked YES**

This instruction defines the convergence point for a potential divergence generation program kernels. This instruction activates the divergence stack module in the GPGPU.

**SSY** (Returning Address)

Example:

**Mnemonics:**

SSY 0xd88

**Example (SASS from NVCC):**

SSY 0xe8 (00000000 a001d003)

**(SASS\_assembly\_lib):**

SSY(int **offset**, int **condition**, int **pred\_reg\_cond**, int **marker**) (The predicate condition is not employed in this instruction, but is present in the code and function description)

**Offset:** (24-9)

**Condition:** (43-39)

**Pred\_reg\_cond:** (45-44)

**Marker:** (1-0)

## I2I instruction (CVT):

**Checked YES**

This instruction performs the conversion of formats among integer values. It should be noted that this instruction is only available for integer operands.

**Mnemonics:**

I2I.(destiny operand format).(source operand format) (destiny location of the operand),(source location of the operand)

The formats in destiny and source may be signed (**S**), unsigned (**U**), and 8, 16, and 32 bits wide. The sources and destinies may be registers, shared memory, constant memory, or global memory locations.

**Example (SASS from NVCC):**

I2I.U32.U16 R0, R0L (04000780 a0000001)

I2I.U32.U16 R1, g [0x1].U16 (04200780 a0004205)

I2I.S32.S32 R1, -R1 (2c014780 a0000205)

**(SASS\_assembly\_lib):**

Formats:

I2I\_32\_16(int **dest\_reg**, int **source\_reg\_1**, char **hilo\_1**, char **sigd**, int **condition**, int **pred\_reg\_cond**, char **set\_pred**, int **pred\_reg\_set**, int **marker**)

**IMUL Instruction:**

Checked YES

This instruction performs the integer multiplication of two operands. The sources can be registers or constant memory locations. The operation of these instructions could be dependable on predicate conditions.

**Mnemonics:**

IMUL.(destiny operand format).(source operand format) (destiny location of the operand), (source 1 ), (source 2)

The formats in destiny and source may be signed (**S**), unsigned (**U**) in 16, and 32 bits wide. The sources and destinies may be registers, shared memory, constant memory, or global memory locations.

**Example (SASS from NVCC):**

IMUL.U16.U16 R2, R2L, R1L (00000780 40020809)

IMUL.U16.U16 R4, R1L, R3H (00000780 40070411)

## IMUL32 Instruction:

Checked YES

This instruction performs the integer multiplication of two operands.

### Mnemonics:

IMUL32.(destiny operand format).(source operand format) (destiny location of the operand), (source 1 ), (source 2)

The formats in destiny and source may be signed (**S**), unsigned (**U**) in 16, and 32 bits wide. The sources and destinies may be registers, shared memory, constant memory, or global memory locations.

### Example (SASS from NVCC):

IMUL32.U16.U16 R8, R6H, R1L (40021A20)

IMUL32.U16.U16 R11, R6H, R2L (40041A2C)

IMUL32.U24.U24 R1, R1, R0 (40400204)

### (SASS\_assembly\_lib):

Formats:

IMUL32\_U16\_U16\_regs(int **dest\_reg**, int **source\_reg\_1**, char **hilo\_1**, int **source\_reg\_2**, char **hilo\_2**)

IMUL32\_U16\_U16\_shmem(int **dest\_reg**, int **addr\_reg**, int **offset**, int **source\_reg\_2**, char **hilo\_2**)

Pending the description...

## IADD Instruction:

**Checked YES**

This instruction performs the Integer addition in (32 or 16 bits) of two sources. The sources can be registers or shared memory locations. The operation of this instruction could be dependable on predicate conditions. Moreover, the operation may modify some of these predicate flags.

Pred: Rx &lt;- Ry + Rz

**Mnemonics:**

ADD (predicate\_condition\_out) (Destiny register) (Predicate\_condition\_in) , (source register 1), (source register 2)

The predicate\_condition must be previously set by other instructions to be used as a condition for the addition operation.

Destiny and source registers are 16 or 32-bit size. The source register seems to be selected among (R0 - Rn), where n is the total number of registers employed by the application.

**Example (SASS from NVCC):**

```
IADD R2, g [0x4], R2          (04208780 2000c809)
IADD R4, R5, R4              (04010780 20000a11)
IADD.C0 R0, R0, c[0x1][0x0] (044007c0 21000001)
IADD.C1 R0, g [0x4], R7      (0421c7d0 2000c801)
IADD R7 (C3.CARRY), R7, c[0x1][0x2] (0440b880 21000e1d)
IADD.CARRY1 R1, R1, R124     (041f1780 30400205)
IADD.CARRY0 R5, R5, R6      (04018780 30400a15)
```

**IADD32I Instruction:****Checked YES**

This instruction performs the Immediate Integer addition in (32 bits) of one source of type register or shared memory locations and one immediate operand.

Rz &lt;- Rx + Imm

**Mnemonics:**

IADD32 (Destiny register), (source register 1), (Immediate value)

Destiny and source registers are 32-bit size. The source register can be selected among (R0 - Rn), where n is the total number of registers employed by the application.

**Example (SASS from NVCC):**

IADD32I R5, R5, 0x4 (00000003 20048a15)

IADD32I R1, R1, 0x1 (00000003 20018205)

## LOP Instruction:

**Checked YES**

This instruction performs the logic operations (AND, OR, XOR, PASS, and NOT) into operands of 16 or 32 bits size. The sources can be registers or shared memory locations. The operation of this instruction could be dependable on predicate conditions. Moreover, the process may modify some of these predicate flags.

Pre: Rz <- Rx **and** RyPre: Rz <- Rx **or** RyPre: Rz <- Rx **xor** Ry**Mnemonics:**

(Predicate) LOP. (Logic Operation).(Size) Destiny, Source\_1, Source\_2

Destiny and source registers are 16 or 32-bit size. The source\_1 can be a register or a shared memory location. The source\_2 can be a constant memory location.

**Example (SASS from NVCC):**

LOP.AND.U16 R0H, R0H, c[0x1][0x0] (00400780 D0800205)

LOP.XOR R7, R7, R8 (04008780 D0080E1D)

LOP.PASS\_B R0 (C0.EQU), R0, ~R4 (0402C500 D0040001)

LOP.AND R5, R3, R2 (04000780 D0020615)

**ISET Instruction:**

Checked YES

This instruction performs the integer comparison of two integer sources. A destiny register can be affected if selected. This instruction affects one flag of a predicate flag as a consequence of the comparison. This instruction can also require an input predicate condition as a precondition for its execution.

Pre: Rx vs Ry

**Mnemonics:**

ISET Destiny. (Predicate condition) , Source\_1, Source\_2

Source\_1, Source\_2, and Destiny are general purpose registers or constant memory parameters.

**Example (SASS from NVCC):**

ISET.S32.CO o [0x7f], R2, R124, GT (307C05FD 6C0107C8)

ISET.S32.CO o [0x7f], R0, R124, GT (307C01FD 6C0107C8)

**(SASS\_assembly\_lib):**

Formats:

## GLD Instruction:

**Checked** YES

This instruction performs the load of an operand of 8, 16 or 32-bits size from the main memory (global) in the GPGPU.

PrE: Rx &lt;- Global\_mem[Rz]

**Mnemonics:**

GLD (Destiny).(size) (Source\_1)

**Example (SASS from NVCC):**

```

GLD.U8 R0, global14[R0]      (80000780 D00E0001)
GLD.U8 R3, global14[R1]      (80000780 D00E020D)
GLD.U8 R1, global14[R4]      (80000780 D00E0805)
GLD.U32 R11, global14[R5]    (80c00780 D00E0A2D)
GLD.U32 R0, global14[R6]    (80c00780 D00E0C01)
GLD.S8 R0, global14[R0]      (80200780 D00E0001)

```

## GST Instruction:

This instruction performs the storage into the global memory of one operand coming from a general purpose register.

PrE: Global\_mem[Rx] <- Ry

### Mnemonics:

GST global14[Destiny\_reg], Source\_reg

### Example (SASS from NVCC):

```
GST.U32 global14[R0], R10      (AOC00781 D00E0029)
GST.U32 global14[R1], R0      (AOC00781 D00E0201)
GST.U32 global14[R6], R5      (AOC00780 D00E0C15)
GST.U32 global14[R5], R3      (AOC00780 D00E0A0D)
GST.U32 global14[R4], R5      (AOC00780 D00E0815)
```

**A2R Instruction:****Checked** YES

This instruction performs the movement of an operand from an address register to one general purpose register.

PrE: Rx &lt;- Ax + Imm

**Mnemonics:**

A2R Destiny\_reg, Address\_reg

**Example (SASS from NVCC):**

A2R R3, A1 (40000780 0400000d)

**(SASS\_assembly\_lib):**

**ADA Instruction:**

Checked yes

This instruction performs the addition of immediate value in the address registers (These registers are employed to address the shared memory in the GPGPU)

 $Ax \leftarrow Ay + Imm$ 
**Mnemonics:**

ADA (Destiny register), (source register), Imm

Destiny and source registers are 32-bit size. The source register seems to be selected among (A0 - A3) instead the destiny may be (A0 – A15)

**Example (SASS from NVCC):**

ADA A4, A2, 0x1b0 (20000780 d8036011)

ADA A4, A3, 0x1618 (20000780 dc2c3011)

## FADD32 Instruction:

**Checked** No, partially implemented, and checking in progress.

This instruction performs the floating-point addition in single-precision (32 bits) of two sources. The sources can be registers or shared memory locations.

FRx <- FRy + FRz

### Mnemonics:

FADD32 (Destiny register), (source register), (source register)

Destiny and source registers are 32-bit size. The source register seems to be selected among (R0 - Rn), where n is the total number of registers employed by the application.

### Example (SASS from NVCC):

```
FADD32 R3, R3, R0      (B000060C)
FADD32 R9, -g [A1+0xd], R3 (B503FA24)
FADD32 R6, g [A2+0x1], -R2 (B9426218)
```

(28-31) 4	Instruction Opcode	FADD32 = 0xD	

## FADD Instruction:

**Checked** No, partially implemented, and checking in progress.

This instruction performs the floating-point addition in single-precision (32 bits) of two sources. The sources can be registers or shared memory locations. The operation of this instruction could be dependable on predicate conditions. Moreover, the operation may modify some of these predicate flags.

Pred: FRx <- FRy + FRz

### Mnemonics:

FADD (predicate\_condition) (Destiny register), (source register), (source register)

The predicate\_condition must be previously set by other instructions to be used as a condition for the addition operation.

Destiny and source registers are 32-bit size. The source register seems to be selected among (R0 - Rn), where n is the total number of registers employed by the application.

### Example (SASS from NVCC):

```
FADD R6, R7, -R6          (08018780 B0000E19)
FADD R0 (C1.EQU), R0, R4  (00011500 B0000001)
FADD.TRUNC R1, R1, c[0x1][0x16] (00458780 B1030205)
```

## FADD32I Instruction:

**Checked** No, partially implemented, and checking in progress.

This instruction performs the floating point addition in single precision (32 bits) between one source and one immediate value. The source and destiny can be registers.

FRx <- FRy + Imm

### Mnemonics:

FADD32I (Destiny register), (source register), (Immediate value)

The immediate value is a 32 bits single-precision operand.

Destiny and source registers are 32-bit size. The source register seems to be selected among (R0 - Rn), where n is the total number of registers employed by the application.

### Example (SASS from NVCC):

```
FADD32I R7, R7, 0x3f000000      (03F00003B0000E1D)
FADD32I R0, R0, 0x49be9b7c     (049BE9B7B03C0001)
FADD32I R2, R2, -0x41000000    (0BF00003B0000409)
```

## FMUL Instruction:

**Checked** No, partially implemented, and checking in progress.

This instruction performs the floating-point multiplication in single-precision (32 bits) between two sources. The sources and destiny can be registers, shared memory locations, constant memory locations, or immediate values. A predicate condition can be present as a precondition for executing the operation.

PRE: FRx <- FRy \* FRz

### Mnemonics:

FMUL. (Predicate condition) (Destiny), (Source\_1), (Source\_2)

Source\_1 and Source\_2 can be the immediate value, shared memory location, or constant memory element. In most cases (*Source\_1 can be shared memory location. Similarly, Source\_2 can be the constant memory location*)

### Example (SASS from NVCC):

```
FMUL R6, R7, R6          (00000780C0060E19)
FMUL R4, -R4, R3        (04000780C0030811)

## FMAD32I Instruction:

**Checked** No, partially implemented, and checking in progress.

This instruction performs the floating-point multiplication and addition in single-precision (32 bits) among two sources and one immediate value. The sources and the destiny most of the time are general-purpose registers. Predicate values are not included as preconditions to execute the instruction.

PrE:  $FRx \leftarrow (FRy) * (Imm) + (FRz)$

The destiny register should be one of the source operands in the MAD operation.

### Mnemonics:

FMAD (Destiny), (Source\_1), (Immediate), (Source\_3)

Source\_1 and Destiny are general-purpose registers.

### Example (SASS from NVCC):

```
FMAD32I R1, -R3, 0x39fd8000, R1 (039FD803 E0008605)
FMAD32I R0, R1, 0x3fc00000, R0 (03FC0003 E0000201)
FMAD32I R2, R3, 0x3b86d46d, R2 (03B86D47 E02d0609)
```

## RCP32 Instruction:

**Checked** No, partially implemented, and checking in progress.

This instruction performs the reciprocal operation of a floating-point value in single-precision (32 bits). This instruction does not require a predicate condition to start the execution.

FRx <- reciprocal (FRy)

### Mnemonics:

RCP32 Destiny, Source\_1

Source\_1, Source\_2, and Destiny are general purpose registers or constant memory parameters.

### Example (SASS from NVCC):

```
RCP32 R1, R1          (90000204)
RCP32 R4, R4          (90000810)
```

### (SASS\_assembly\_lib):

Formats:

Not implemented yet...

Bit(s)	Mnemonics	Commentary	
0	instr_is_long	<b>0</b> = 32 bit long. <b>(Default)</b>	<b>1</b> = 64 bit long.

(28 – 31) 4	Instruction Op. Code	RCP32 = 0x9	

## Especial function unit instructions

**SIN**

**COS**

**RRO**

**EX2**

**RSQ**

**LG2**

**SIN instruction:**

Checked **Not implemented**

This instruction generates the approximate SIN operation of an input operand in the format of 32 bits floating-point.

**Destiny\_f ← SIN (Source\_f)**

**Mnemonics:**

Direct SIN: **SIN Rx, Rx**

**Example (SASS from NVCC):**

SIN R1, R1 (80000780 90000205)  
SIN R12, R12 (80000780 90001831)

**(SASS\_assembly\_lib):**
