Contents

Preface	ix
Introduction	xiii
Chapter 1. Introduction to the Wiener-Hopf Method	1
1.1. A brief history of the Wiener-Hopf method	1
1.2. Fundamental definitions and assumptions to develop the Wiener-Hopf technique in the spectral domain	1
1.3. WH equations from the physical domain to the spectral domain	4
1.4. WH equations in wave scattering problems	5
1.5. Classical solution of WH equations	8
1.6. The decomposition (Cauchy) equations	11
1.7. General formula for factorization of scalar kernels	13
1.8. Some explicit factorization of matrix kernels useful in wedge scattering.	15
1.9. The Fredholm factorization technique: a general technique to solve WH equations	19
1.10. Spectral properties of the unknowns	22
1.11. Semi-analytical solution of the Fredholm integral equation	25
1.12. Analytic continuation outside the integration line in the η -plane	28
1.13. The complex plane w	30
1.14. The WH unknowns in the w plane	34
1.15. The Fredholm factorization technique in the w plane	36
1.16. Analytic continuation in the w plane	40
1.17. The Fredholm factorization technique to factorize the kernel	42
1.18. Some examples of the Fredholm factorization method	45
Appendix 1.A: effect of using j and i as imaginary units in Fourier transforms.	52
Appendix 1.B: compactness of the matrix kernel $\frac{G^{-1}(\alpha)G(u) - \mathbf{1}}{u - \eta}$	54

Chapter 2. A Basic Example: Scattering by a Half-plane	59
2.1. The fundamental problem of diffraction in wave motion	59
2.2. Unified theory of transverse equations in arbitrary stratified regions	62
2.3. WH equation for electromagnetic diffraction by a perfectly electrically conducting (PEC) half-plane illuminated by an Ez-polarized plane wave at normal incidence	67
2.4. Non-standard contributions of WH unknowns in the PEC half-plane illuminated by an Ez-polarized plane wave at normal incidence	69
2.5. Solution of the WH equation of the PEC half-plane using classical closed-form factorization.	71
2.6. Solution of the WH equation of the PEC half-plane using the Fredholm factorization method	72
2.7. Field estimation	73
2.8. Numerical validation of the Fredholm factorization method.	85
2.9. Generality of the wave motion in a homogeneous isotropic elastic solid	91
2.10. Plane waves in a homogeneous elastic solid and simplifications.	103
2.11. Diffraction by a half-infinite crack in a homogeneous elastic solid planar problem	110
2.12. Diffraction by a half-infinite crack in a homogeneous isotropic two-dimensional elastic solid problem	113
 Chapter 3. The Wiener-Hopf Theory for Angular Region Problems.	 123
3.1. A brief history of the classical methods for studying angular regions.	123
3.2. Introduction to the generalized Wiener-Hopf technique	125
3.3. WH functional equations in the angular region filled by a homogeneous isotropic medium in Electromagnetics	127
3.4. Reduction of the generalized functional equations of an angular region to functional equations defined in the same complex plane.	141
3.5. Generalized Wiener-Hopf equations for the impenetrable wedge scattering problem	151
3.6. Solution of generalized Wiener-Hopf equations for the impenetrable wedge scattering problem	153
3.7. Non-standard parts of the plus and minus functions in GWHEs for the impenetrable wedge scattering problem	154
3.8. Closed-form solution of the PEC wedge scattering problem at normal incidence.	158
3.9. Alternative solution of the PEC wedge scattering problem at normal incidence via difference equations.	160
3.10. Generalized WH functional equations for angular regions in the w plane	164
3.11. Rotating wave method.	167
3.12. Properties of rotating waves.	172

3.13. Spectral field component in w for an arbitrary direction φ using rotating waves	178
3.14. Rotating waves in areas different from electromagnetism	180
3.15. Closed-form solution of the diffraction of an elastic SH wave by wedge with classical factorization	182
3.16. Rotating waves with the MF transform for wedge problems	185
3.17. Alternative solution of PEC wedge scattering problems via difference equations and the MF transform in terms of rotating waves	187
Appendix 3.A: the Malyuzhinets–Fourier (MF) transform	188
