Three underground karst laboratories are present in Bossea cave for environmental parameters monitoring:

1 - Bossea Karst Hydrogeology Lab: water flow, temperature and electrical conductivity monitoring

Bossea cave is located in Frabosa Soprana municipality, Piedmont, Italy. It is the first Italian show cave, opened to the public in 1874.

Monitoring system in real time

Signal cable

Underground collector flow rate from January 1982 to November 2017

Underground collector flow rate from November 2017 to May 2023

Secondary intake flow rate and electrical conductivity in 2018

2 - «Giovanni Badino» Climatological Research Center of Bossea Cave: air-rock-water temperature and CO₂ concentration monitoring

Data loggers are housed in boxes to be protected from air humidity

Probe for air temperature monitoring

Sacrestia monitoring point (15 m deep from the surface): trend in rock temperatures (measured in holes of 100, 50, 5 cm depth) and air temperatures from May 2021 to May 2023

Milano monitoring point: trend of air, rock and underground collector water temperature between June 2021 and May 2023

The monitoring points in the touristic area of Bossea Cave

CO₂ air concentration data logger

CO₂ air concentration probe

CO₂ air concentration monitoring in touristic and non-touristic parts of the cave (2022)

Porfiroidi monitoring point: trend of the collector water and air temperature at different heights, between April 2022 and April 2023.

3 - Underground Karst Laboratory of Bossea (S.O. Bossea CAI): air-water-rock radon concentration monitoring

Equipment for water radon concentration monitoring

Space-time trend of the radon concentration along the longitudinal section in the Bossea Cave

Correlation between radon concentration trends at different sites (the correlation index $r=1$ implies the cake is fully colored; $r=0$ implies a white cake).
